Logo came with the first ST's on the language disk. It never became very popular unfortunately, so it was never upgraded. Digital Research, who wrote the language did some weird things with the file selector, and that is where things went wrong when I installed TOS 1.4. I didn't have any time yet to check for a possible fix.

Erlend.

1721. Want to buy a Stacy

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-31 18:54:26 UTC
From: pstoaks@spider.mentorg.com
Message-ID: <2nf692$l7f@hpbab.mentorg.com>

Yes, you should increase the size of the input buffer:

```
flushmidi();
Ioptr = (struct iorecinfo *)(Iorec(2));
Origbuf = Ioptr->ibuf;
Origsize = Ioptr->ibufsiz;
Ioptr->ibuf = malloc(MIDIBUFSIZ);
Ioptr->ibufsiz = MIDIBUFSIZ;
Ioptr->ibuftl = Ioptr->ibufhd = 0;
```

I would suggest that you either replace the power supply with a non-Atari
unit (available from Best Electronics, here in the state at least) or
mount your hard disk in an external case. The latter should reduce the
load enough to use the Megatalk board without problems (a guess, but easy
to test). Atari power supplies are famous for being wimpy.

Hope that helps.

>and then crashes, but mostly it crashes before it even gets that far.

Most problems that I have had with Ataries is with the PLCC devices
having dirty contacts...

The other one that I had was a Mega ST that had TOS 1.04 fitted by the Agent
here, guess what they done the normal thing and bent under one of the Rom
pins, this I have seen many many times in the course of my work as a Computer
Engineer....

Did the machine work for some time after the mods,,?? days, weeks, months.?

The other thing to try is to disable the top 2 meg Ram banks...

Yes it does but the Falcon also has ANOTHER serial port which can
achieve faster speeds. It goes quite fast. ;)

It is not true, but you can't acces the higher rates via the Control Panel. Most new comms programs like Connect support rates up to 150kbaud on the Falcon. I get around 3000 cps on text and 1700 cps on compressed files with a similar modem.

If you haven't seen them, there are a couple .IMG pics in a file called
FALCNBUG.ZIP on atari.archive.umich.edu:/atari/Falcon This _HUGE_
.IMGs show how to modify the machine to combat some hardware deficiencies
involving the hard drive and also some sound problems. They appear to
be converted to .IMG from a FAX, I had to reduce them to 25% of size
to get them to print on one page using PageStream...

Why should a 19.2 serial port preclude use of a 14.4 modem?

For what it's worth, I'm running my Falcon right now at 38.4 with a 14.4
modem (which ran just fine when I was running the Falcon at 19.2)

Sounds very bad. Is this the old, non-autoswitch version? I had it
until the upgrade to autoswitch, worked first time. You have probably
checked already, but I can only suggest you check again
(component-types, values and orientation(+/-)).

good luck, david (davidb@sterbbs.nl)

Not a library function. Probably you meant 'while(Bconstat3)) Bconin(3);'.

> Ioptr = (struct iorecinfo *)(Iorec(2));

The cast should be '(IOREC *)', and is not needed anyway, since Iorec() already
returns a 'IOREC *'.

> Origbuf = Ioptr->ibuf;
> Origsize = Ioptr->ibufsiz;
> Ioptr->ibuf = malloc(MIDIBUFSIZ);

This is asking for Big Problems. *Always* check the return value of malloc().

> Ioptr->ibufsiz = MIDIBUFSIZ;
> Ioptr->ibuftl = Ioptr->ibufhd = 0;

Sorry, just in a picky mood... :-)

>French at all..... Please repost the reply...this time in English.

Ok, Mea Culpa: I didn't SEE the crosspost!

I said that the GE Software wasn't worth a dead cockroach, furthermore
there ARE some bugs in the adapter card itself, especially with
extensive SCSI use (like, hard disks will work fine, but I don't
know about Tape drives our CD-Roms).

ICD on the other hand works perfectly, and (as Ralph Sobek corrected)
their software works with any hardware (it doesn't need to recognize
an ICD board adapter online).

>OK, so you are French and can speak English......why shouldn't I know French...

Sorry about that, again!

>So please take pity on me....and repost in English

Done! :-)

1736. QUES: Gulam from GNUmake

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-01 15:30:03 UTC
From: bobhays@spss.com
Message-ID: <bobhays-010494093003@haysmac.spss.com>
Source record: 33566

I pulled GNUmake from a umich mirror and it works except when it has to spawn a shell - then, it barfs. I tried adding a SHELL variable def as per the notes, but then it failed to find the gulam.g file. I defined shell as:

SHELL=e:\gulam\gulam.prg

Any suggestions? If I get past this one, I think I've got gcc and g++ all set (now that I have matching g++ and ginclude files:-).

Thanks and have fun! - Bob

ja> this is the old overscan, yes...
ja> what is this autooverscan? how much and where can i get it?

Auto-Switch Overscan. It switches automatically between overscan and
normal mode or not, as you start applications, depending on the
contents of a overscan.inf file. Very convenient.
The hardware consists of a small board with one chip, some small
stuff and a lot of wires. Takes quite some surgery to install.
I Guess it should cost about 70 US$. It is widely available in
Germany and Holland, don't know about UK (i think it is). And i sure
don't know about US.

1747. HELP! I've killed my Mega!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-02 03:11:31 UTC
From: steveg@cseic.saic.com
Message-ID: <22305564@MVB.SAIC.COM>
Source record: 33578

The Patient: Mega 4 w/ICD AdSpeed, motherboard modified from 2 chip to
6 chip ROM set (when I went from TOS 1.2 to 1.4)

History: A couple years back I stuck in a board from Wizztronics that let me
switch between TOS 1.0 and 1.4. All was fine but board had to just
'lay' inside the box - no problem as machine never moved and was
securely wedged between my hard drive case and monitor.

Well, I just sold this thing on the net and wanted to remove the
board before shipping, so out with the board, and back in with the
1.4 chips. Then...

Symptoms: On a color monitor when I turn it on, I get a white border, and
solid black screen. Floppy drive never lights up. Have tried
various ROM orderings just in case I got hi/lo banks switched etc,
with no effect (tho some combos yield solid white screen).
Same happened when I tried the 1.0 ROMS direct on the board
(in case I had zapped one of the 1.4 ROMS). I've moved ROMS
on this machine and many others before, and aside from the
occasional bent pin or two, have never had a problem.

Prognosis/Cure: Do the above symptoms ring a bell with anyone? The machine
has been working flawlessly for years. There were no obvious
flames, smoke, or screams of pain. No traces were cut or
jumpers moved to my knowledge. Any ideas?

Please reply by *MAIL* I'll summarize if I find a cure.

1748. How does the sound chip play back samples?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-02 08:39:52 UTC
From: mike@ionews.io.org
Message-ID: <2njb0o$kjp@ionews.io.org>
Source record: 33579

I'm working on hooking up an ADC to my ST, and found some good information in a book called 'Midi and SoundBook for the Atari St', by Bernd Enders, and Wolfgang Klemme.

They have some example code to play the samples *out* through the sound chip.

The code is working, but it's a mystery to me how it works.

What it seems to be doing is using the sample data value to index into a table of amplitudes to be sent to the sound chip. Ok I understand that.

What I don't understand, is that the initialization code turns the sound channels *off* by setting reg 7 to 0x00111111.

Then to play the sample data, only regs 8-9-10 are being loaded with amplitude data. Don't the channels have to 'enabled' with a 0 value in one or more of bit positions 0-5 ? .. Apparently not.

Does anyone 'here' know how this works?

True. I've even considered working on something like that, but I know
nothing about SGML, the basis for HTML... Doesn't HTML implement all
SGML tags as well as the extra hypertext stuff?

I got this when compiling stuff for MiNT, so I just added a '-mint' flag,
and that fixed it. I think it just wants MiNT libraries...

Take care,
Charlie...

This is what I want. My xb_old already points to the last
program to catch trap 2. If I gave them the Setexc call, they would
overwrite trap 2 and cut me out. If someone else stole trap 2 in the
meantime, (this is the usual case since I have to start mfsfm after my
program), I will never see the Setexc call and I will remain in the
trap 2 vector automaticly.
```

> (Besides, you forgot to handle a special case: if the new vector

If I load after mint, I should actually ignore the super bit.
Otherwise, mint will send all Setexc(101, ...) calls down the xbra
chain in super mode, and programs started before mint will unhook me
from trap 2. The only time I have seen this happen is with xya.ttp.
Before I wrote my trap 13 handler, I looked at chameleon, quickst
2.2adspeed and mfsfm. It is possible that I misread them, but I
really doubt it. I think this alternate scheme, even if it is better,
will only succeed in allowing other programs to unhook me from trap 2
when they handle Setexc in the usual way.

> jumpers moved to my knowledge. Any ideas?

To fit TOS 1.4 6 chip set to a MegaST with a TOS 1.2 2 chip set you had to do
the following (so reverse the mods):

Jumper W2 (bottom left edge of the board) moved from 2-3 to 1-2
Jumper W3 (bottom left edge of the board) moved from 2-3 to 1-2
Jumper W4 made with piece of wire

Chip U12 (SN74LS11N) had its leg 12 cropped or the whole chip removed.

I'm writing an accessory with a window that opens (and is created when opened the first time) when the accessory gets an AC_OPEN message. The window opens fine when I first load the accessory, but as soon as I run a program, the window doen't open after that. I send GEM a wind_open command, but the window just doesn't appear.

I'm using a Falcon without MTOS. Does GEM delete the window when I run a program? How do I know if GEM has done this or not? Do I have to re-create it then?

Thanks in advance!

The problem is not 2 ROMS vs. 6 ROMS.
When I first went to TOS 1.4, the proper mods were made and 6 sockets
placed on the motherboard.

The switchable TOS board was switching between 6 chip sets of 1.4 and 1.0.

All I did was put the 1.4 chips directly in the sockets (vs. the board's
connectors). The 2 chip set of TOS 1.2 is completely out of the picture.

Message-ID: <1994Apr3.040222.10709@news.csuohio.edu>
Source record: 33588

Greetings all!
I really hope that there are a few of you out there that can answer my questions I have. I have a 1040STf and I really want to tweak it out, As part of my physics project. I am going to want to upgrade to 4 megs RAM. What is the cheepest way to do this? I also want to go from the whimpy TOS1.08 to at least 1.4. Who do I contact for that? The Major thing I want to do though is that mem upgrade. It is for a grade...well at least the lab write-up is. I would however like to turn in a project that actually has the item I write about built.
An for my final question, I need some software. I need to know where to get a hold of SimCity for the ST...Don't we all need to relax?:) but more importantly I need MIDI software. WEither Shareware or not., I know Dr.T's has some good stuff but I don't have that money now. I have Alchimie JR here that I got off of archive.umich.edu and it will not run for me...gives me two bombs or a TOS 35 error...it decides. I have a show I need to drop some samples at and I am going to do it via the ST. However for that to happen I need a working program that will spit out sound samples when I want it to.
I really would appreciate as much help on this as possible and as fast as possible. Thank you very much!

-J.Starr

```
M A S T E R B R O W S E S U R V E Y
-----------------------------------

Hello,

Since MasterBrowse was first released, one year ago, it has grown in
many ways. Unfortunately, one of the ways it has grown is in size. I
am writing this survey in an attempt to determine if MasterBrowse has
become too large, and what should be done about the problem if it has.

To take the survey, simply answer ALL of the questions below, and
send the reply to:

mforget@elfhaven.ersys.edmonton.ab.ca

-------------------------------------------------------------------------------

1. Do you feel that MasterBrowse is too large? It currently uses 150K
of disk space, and 315K of memory. (This is for the unoptimized
version, though. The optimized version is 26K smaller.)

2. If MasterBrowse is too large in your opinion, which features should
be removed?

3. What features would you like to see MasterBrowse have? (For
example, the next version of MasterBrowse, currently under testing,
has full Unix regular expression matching, rounded radio buttons,
and real checkboxes with crosses.)

That is all there is to it! (Short survey, huh? If you have any kind
of opinion about MasterBrowse, let me know what you think!)

Ok, now that I got your attention. I've got a 1040ST, ICD host adapter on a 40 meg HD, and a 4 meg upgrade card in the box. I recently switched out the 1-meg simms and put in 256k simms so my 1040 is a 1-megger again.
Working with such a cramped RAM though I need every byte, so I've noticed that no matter how I configure the HD and boot-up, no cache, no accessories, etc., I can't get more than half a meg of free RAM. Since TOS is in ROM, I thought I'd have close to a meg to play with. What's the scoop?

Yes, But what is now the staus of it?
Trash-Can ware?
May it be resold (once, without keeping another copy!)
as any other sw-package one has bought ?

Is it in the PD?

>It never became very
>popular unfortunately, so it was never upgraded. Digital Research, who wrote
>the language did some weird things with the file selector, and that is where
>things went wrong when I installed TOS 1.4.
The 'weird thing' was, that te program grabbed all the memory it could
get. It over left nothing! So even the OS could no longer open a fileselector box.

> I didn't have any time yet to check
>for a possible fix.
Some (long) time ago a fix for the mentioned problem was publishe in a
jounal.

>Too dear? my buy price on the IDE adapter (and that's not as a dealer) was
>a smidgin under A$100.00, INCLUDING FREIGHT.

Are we talking a Internal Hard Drive..??

The ICD Micro Host is $39us, this is for a Internal Hard Drive, the
LINK is for a External Boxed Hard Drive, I don't think you know what you are
talking about....

What software supports the IDE host adapter, verly little I think, I would
rather stay with some thing thats fully suported...

>The last price I was quoted on an ICD link here was about twice that, and

No the Micro Host is $39us....

>As far as 'slow' is concerned, I don't think so. In fact, I know so.
>A megaST2 is not going to be able to stress any modern drive, IDE or SCSI
>anywhere _near_ its limits - on the ST2 I just did I was getting over 700K/sec
>with the somewhat bogus AHDI 6.x (HuSHi 4.07 had some problems with his

>6 Watts..

Just make sure you get a low power drive. I got a Quantum LPS120 3 1/2
drive and installed it into my Mega2 using the AdSCSI Micro Kit. Next
thing I noticed were frequent bombs and full crashes after 1 to 2 hours of
running the computer. Switching it off for a while gave me another two
hours. Finally the ST would not start up (black screen).
Why ? The BRACKETED !!!! MMU chip which sits directly under the HDD had
moved sufficiently out of the socket, because the drive above the chip
got frying hot. The small fan of the power supply cannot cool the drive.

Result: a second hand lift-top PC case and PC fan to house the ST board
and drives.

>ICD was doing a clear out sale (1993) for these host adapters called,

>For what it's worth, I'm running my Falcon right now at 38.4 with a 14.4
>modem (which ran just fine when I was running the Falcon at 19.2)

Since V.42 at 14.4kbps yields up to 57.6kbps, a 19.2kbps serial port
would limit throughput to 19.2kbps.

There are several hard disk drivers that support Falcon compatible IDE (AHDI,
HUSHI, HDDRIVER). You don't need more than that because other applications
are not concerned with the type of hard disk you use. So IDE is no problem
at all.

Yeah. Gulam is non-reentrant. Try getting a shell (as opposed to a CLI --
nothing against gulam, but there's a difference between shells and CLIs)
like tcsh or bash. If you have enough memory to run g++, you should have
enough for multiple instances of tcsh.

Not all 14400 modems can handle 57600 DTE, and some can use 115200 ... you're talking about the MAXIMUM throughput you can get with YOUR modem .. and on compressed files you'll NEVER reach above 19200 with a 14400 modem ..

(Yes, I've been using 14.4 modemsfor a LONG time, and 19200 DTE is more than enough, even though my moem can do 16.8 aswell.)

Not true. I've seen it do 115200 (or something) on a direct ZModem connection
to a DOS box. Modems happily run at 57600 (or higher, I didn't try). You'll
need a terms program that supports these speeds, however.

bye, Peter

1781. Notator 3.1 on a Colour monitor

Newsgroup: comp.sys.atari.st.tech

True, but the 4:1 ratio is potential, not sustained. It is unlikely that
you will greatly notice the difference between 19.2 and 57.6 on a 14400 baud
modem. I get (on my MegaSTE) about 1650-1700 CPS sustained during binary
downloads (this translates to 16500-17000 baud). Text, while reading news
for example, might burst up to 1920 CPS occasionally, but not very often.
So, while it is nice to have it set that high, it is certainly not necessary
to get excellent performance from your modem.

Without MTOS, GEM sends an AC_CLOSE message when it starts another
app. This means that it has *already* closed and deleted your window
for you.

Actually, the libs with the latest version of Lattice (v5.6) only
contain Mint bindings (mintbind.h, cf osbind.h); the standard library
itself does not know about Mint. So the free mintlibs are actually
darned useful for Lattice too.

I have a feeling that libs built with Lattice 5.6 will not work with
Lattice 5.06, but I'll try to post you something next week (I'll build
'em this weekend). Any particular model you want? 16-bit or 32-bit etc
etc?

I am not going to argue about memory requirements, though gulam
requires less! Anyhow, there is a special way to call gulam (with an
extra argument) so that cp, echo, rm would work out of make. I did
manage this some time back when all I had was a 1040 ST. I think it
is described in the Gulam manual. Gulam _is_ partially reentrant!

1791. FALCON 030 DSP D/A converter wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-05 12:37:56 UTC
From: Jens.Burkert@arbi.informatik.uni-oldenburg.de
Message-ID: <1994Apr5.124330.8632@arbi.Informatik.Uni-Oldenburg.DE>
Source record: 33472

HI
The D/A converter in the Falcon cut frequenzies over 10 KHz and
makes a Bass boost.
I'm looking for a external solution to get a linear output.
Any suggestions ?

And I'm lookin for a good DSP an C developing Pack.
All software I got gcc asm68
didn't work well (compiler errors, missing librarys).
Where can I get a working one ?

Thanks in advance
Jens

bi>Does anyone know if such a file exists for either the ST or UNIX?
bi>I have a need to print *.IMG files at school.

What exactly do you want? As i understand it, img-files can be
included in an eps-file, making it possible to print img-files via
a ps-interpreter (or ps-printer, i expect). But this is almost the
same as printing the img directly. It is not such an uncommon
file-format is it? Why not convert it to unix-native bitmap-format?
Alternatively you can convert the img to a vector-file ('tracing'),
exporting it as eps (or gem, or cvg). On the st this can be done
using Avant-Vector (was distributed on the coverdisk of some
uk-magazine recently).

This is just to let everyone know that ICD is starting to ship their latest version of the Pro Utilities (version 6.4.3 - if I didn't transpose the 4 and 3). I had ordered an update from them back in late January. I called in early March to see what was happening - and they said they were holding my order since a new version was just about to be released. I concurred with them that the wait would be worth it to me. Yesterday the new version arrived. No report yet on it. So to all the naysayers out there - sorry, but ICD is alive and well and still producing updates for our systems. Amen.

> i restart Upoint...Very annoying!).

Yep, I have this bug too. The solution is to quit back to the
newsgroup selection screen and then re-enter the newsgroup. Also
another bug is that if you have written any-newsitems, you have to run
the make index menu-item before you poll the remote site. If you
don't, the newsfile will be deleted after transfer, _before_ it gets a
chance to be indexed into your own local news. This leaves a *.y file
hanging around in the OUT directory which means you will get an error
message everytime the Indexer is run, because it can't find the data
file. If this happens, the solution is to delete any odd *.y files in
your OUT directory.

1798. format of the colour icon resource files

Does anyone know what the DESKICON.RSC format is ? I know there are some commercial editors, and one pd one that I know of, but no source is available...

What I want to do is have a program that reads in the .xpm files I have (some 6 Mbytes) and writes a file for me that the desktop will read. I (obviously) don't want to use all these icons, but there are some very nice ones. Basically they're all the windows icons converted to Xpixmap form.

If the guy who wrote iconedit is reading this, I'd really appreciate it if you sent me the above info.

ATB,
Simon.

1799. EMACS 18.58 help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-06 00:40:26 UTC
From: pstoaks@spider.mentorg.com
Message-ID: <2nt0dq$kk2@hpbab.mentorg.com>
Source record: 33482

Earlier I posted a request for help with EMACS 18.58, and
I thought I would let you know what I found. I then have
another question. The problem I was having was that I
couldn't dump EMACS because it couldn't find the Lisp
library, even though I had the EMACSLIB environment
variable set correctly. It turns out that the archive
has all of the LISP code in a directory named 'e-lisp'.
It turns out that EMACS doesn't like this name for some
reason. I solved the problem by creating a link in the same
directory named 'lisp' that pointed to 'e-lisp'
(i.e. lisp->e-lisp). I did this using Bash. It didn't
matter whether I set EMACSLIB to 'e-lisp' or 'lisp', EMACS
dump worked great. Dumping the 'temacs' binary suggests that
the problem lies in an internal path to EMACSLOADPATH/../lisp.
I can't be sure.

Anyway, my next question. Life is good, EMACS runs reasonably
well, (although it still has some trouble finding library files
unless you give it a full pathname, which I have done in all
cases that matter), but it crashes every time EMACS needs to
do garbage collection. I get two bombs (? Seg violation ?) a
few seconds into garbage collection. Anybody have any ideas as
to what is going on?

G++ is working well for me (even in 2 MB, as long as I use
MSH from MWC instead of BASH, and don't use gmake), and I am
very impressed with the gem++ GEM library. Kudos to the author!

You should be able to do that with Mxalloc(). Set bit 3 of the 'mode'
parameter to indicate that you want to change the protection mode of a
region. Bits 4-7 contain the new protection mode, as usual.

No ITS ICD that has a clear out sale, I should know I brought 4 Micro Host Adapters...

Contact them on GEnie or there BBS.....

NOTE: this host adapter is intended for the Mega ST, it does not come with a 19 pin cable to pug into the back of your ST etc, but they have been used for external hard drive, the Power drives are one that used this host adapter for a very small drive...

It's the audio output stage rather than the DAC which contains the bass boost.
I've seen and *internal* solution in some German (:^>) magazine or other, it
didn't look that hard. Cut out that wretched internal speaker while you're
in there :).

> And I'm lookin for a good DSP an C developing Pack.
> All software I got gcc asm68

The official Atari toolkit includes DSP assembler and debugger. It costs
about 150 DM plus your a nondisclosure agreement, and you get it from a guy
called Kilwinger at Atari in Vianen, NL. Warning: this is about as easy as
getting blood out of a stone. :{ But I've got mine now, and as soon as my
SCSI drive arrives I'm going to have some fun.

(Hey I'm having a lot of fun already, but it's got nowt to do with DSP 8->).

Perhaps he meant "virtually 57.6k", a la data compression
(where the apparent throughput might be higher due to such
compression, though the actual transfer rate might not be quite as
high). Of course, data compression probably doesn't do much for ya
(may even work against ya) when transferring already-compressed
stuff (like ZIPs, LZHs, GIFs, etc)...

Both AHDI and HDDriver work very well with IDE drive on the Falcon. I
experienced no problems. It is slower that SCSI, but I still get about
800k/s on my Seagate which is not bad.

Get the pbmplus package from ftp.ee.lbl.gov, it will convert GEM .IMG
files to portable format, and converts portable format to PostScript.
I haven't checked to see if an Atari port exists but it will certainly
run on your Unix box.

>is described in the Gulam manual. Gulam _is_ partially reentrant!

True. In fact, requiring "multiple instances of tcsh" implies that it
is *not* re-entrant (otherwise you could get away with using only a
single instance of it, right??). Gulam installs a special routine in
the TOS _shell_p system vector, provided specifically for this purpose,
that probably no modern software ever uses any more. (Is it completely
forgotten or something? Oh well.) The _shell_p routine is called with
a command-line as an argument, and the installed shell is supposed to
Do The Right Thing with it - spawn the specified commands, perform any
I/O redirections expected, etc.

I've never seen much (or any!) documentation on the use of this vector;
in particular, nowhere is it written what kind of shell syntax to expect
there - DOS shell, Bourne shell, C shell, who knows what. Perhaps this
lack of specification is what made its usage die out. Or perhaps it's
just not meaningful in this age of MiNT and shared-text shells...

Anyway, your problem with GNUmake is that it is spawning a brand new
copy of Gulam each time it wants to execute a command line, and Gulam
wants it's gulam.g file to be in the current working directory whenever
it is started from scratch like this. One of the unfortunate behaviors
you get from porting Unix software directly to the Atari - every command
is a new process. While process startup is supposed to be cheap on Unix,
and generally is cheap on Ataris too, it's far more efficient to look
for and use an already-loaded shell and take advantage of its built-in commands
than to spawn a shell process that has to spawn more subprocesses of its own
to handle a command line.

So it goes.

Yes, that is what I meant. On text transfers, I've gotten rates
over 20,000bps on my 14.4kbps modem w/ V.42 with my serial port
set at 38.4kbps. However, I usually transfer pre-compressed
files, which cuts the data compression down a bit.

1817. Fax/BBS SW combo for Atari

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-07 07:54:57 UTC
From: cgra@se.alcbel.be
Message-ID: <4378@btmwj1.se.bel.alcatel.be>
Source record: 33350
Cross-posted to: comp.dcom.fax,comp.sys.atari.st.tech

I have a Mega ST with a fax/data modem and its own 'phone line, and I'm looking for software that allows people to dial into me with either a fax or a data call. The combination Qfax/Pro + Michtron BBS (old cover-disc version) *nearly* works, but after one modem call the BBS hogs the line and no more calls can get in.

If the fax part of the software were to support Class 1 then that would be k00l.

TIA, Chris

>Do The Right Thing with it - spawn the specified commands, perform any
>I/O redirections expected, etc.

Someone else in this thread mentioned this feature of Gulam using _shell_p
too. So I thought about writing a little program that takes some arguments,
converts them back into one string, checks whether Gulam is running (using the
magic number it is supposed to install at *_shell_p - 12l) and then calls
Gulam through _shell_p. If the program were to be called 'GU.TTP', then setting
the SHELL variable to GU in GNU-make would speed up things considerably.

Now I tried to do this on a Falcon, but for some reason reading the value
stored at _shell_p (which is 0x04f6 I believe) bombs (2 bombs = bus error)
in normal mode of operation. However, if I tell FalconSX to set the bus to
STe instead of Falcon (whatever that may mean) I can read the value, but it
doesn't seem to contain a valid address. Strangely enough, gdb can read
the value of _shell_p without any difficulties, but returns 0x0l. Can anybody
tell me what's going on here?

You're talking V.42bis now, V.42 is only about errorprotocols, no
datacompression.

Source record: 33353
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a problem with GEMINI 1.99.
Several programs (make, cc) seem to "forget" the environment
varables when started from the console window. They cant fing the
programs they are supposed to kick off (cc in the case of make, and
cc0 in the case of cc).
When i leave gemini and start a shell (msh or gulam) from the atari
desktop all works well.
I have tried to use gemenv.prg, but gemini starts to complain about
illegal env names (ENV$ROOTSIZE and ENV$OPTIONS). other env
variables defined in the root.env file are available in gemini, but
the problem with make and cc still remains.
Can anybody help me?

All significant hard disk software I am aware of (AHDI, ICD, HDDRIVER and
Hard&Soft's).

>I get 1200, so your IDE is VERY VERY SLOW. even PC clone users that I know
>state that IDE is very slow, so you don't know what you are talking about
>again..

It depends on the drive and the computer. As I said, you can get over 1MB
/sec with a Quantum LP120A, and much more when you have a faster machine.
Connected to a Falcon, an IDE drive can easily outperform a comparable
SCSI drive (because the SCSI controller seems to be limited to transfer
rates < 2MB per sec).

>No your ratings are a BIG 0, the TOS 2.06 does not fit into the ROM sockets
>but the Buss expander....

???

The IDE host adapter from H&S is *designed* to be used with TOS 2.06
ROMs. Perhaps *you* don't know what you're talking about?

>Go back to School and learn some thing about Computers/Electronics, you now
>very little about both these subjects, to me you sound more like
>a Amiga whinger..

I won't comment that. But please check your behaviour, you won't impress
anyone with mindless flames like that.

With a plain 260 ST and a Quantum LP240A, you can get a sustained transfer
rate of > 1024 KByte / sec. The same drive connected to an SCSI adapter
should be a bit faster, but not much. In fact, the IDE drive will be
faster for short transfers, because the programming overhead is
significantly smaller.

I need help with the following problem: I recently connected my Falcon to a TV via a Scart cable made for the ST. After some time my screen starts to flikker, untill it's totally unreadable. The people U spoke had the same problem but instantly instead after some time. This may be caused by the fact that my TV accepts NTSC as Pal. The manufactors of the cable said that they couldn't fix it. After that I found out whta the problem was: the 16 Hrz proccesor time. If i switched it to 8 Hrz I got a clear and stable picture. According to the Manufactors this is impossible, so it was a shame I didn't have a vid phone (;-)). Does anybody outthere know a) Is it possible to make a VBL/VBI routine to stop it, or b) is there a correct Scart cable for the Falcon, or c) Is there a blue print of a correct Scart Cable?

Joost.

1827. MEGA STE/Stereo Sound

I have posted this question once but I forgot which group I posted in.
So I thought I would hit them all:)

I was wondering if there is a QWK compatible door for BBS express 1.87(I
think). This is for a friend who does not have access to the net but
wanted me to check for him.

I am currently reading this group and find out now that I wish I had had
an atari when I first started out. These seem like nice machines.
Anyway, I am cosysop on his board in charge of the MSDOS files.

A shameless plug is in order. If anyone wants to check it out the
number is 1 606 886 0914. It is kinda small right now but growing. The
BBS is called Darkforce BBS and supports 1200-14.4 callers.

Any help anyone can give will be greatly appreciated.

 Sign v1.0 End of Message.
Beware of bugs in the above code; I have only proved it
correct, not tried it.

Better check also that the address in shell_p has a valid command
(jmp), because some programs leave shell_p 'on' when exited.

Btw. old Mupfel also installed shell_p.

1832. Fsck may have trashed my MinixFs. Anyone else had this?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-07 17:14:00 UTC
From: woodford@esca.com
Message-ID: <1994Apr7.171400.13146@esca.com>
Source record: 33364

If you use MinixFs and have suffered a corrupt root filesystem,
read on, and let me know if the following events are something
you've seen before:

System Config: ST, TOS1.4, MiNT1.09, MinixFs PL9

I regularly run fsck (ie. every other day) on my 64Meg MinixFs
partition (e:), usually while my current directory is U:

A few days ago, I strayed from my usual routine and ran it while
8 directory levels down in the MinixFs partition. It passed with
no problems found. But, when fsck finished, an 'ls' showed that
my current directory was root! (of e:) I should have realised at
the time that an inode had been trashed, but....

However, later on after a reboot (I always do a 'sync' first), the
MinixFs partition refused to come up. Both MinixFs & fsck reported
that the root inode was not a directory. I'm sure you can imagine
my delight at seeing this... (I do backups once a week, so only
recent stuff would be lost).

Anyway, I dug out the disk editor and found that inodes 1 & 2 had
indeed been stomped on: (mode, nlinks, size & 1st block address had
been corrupted or zeroed). There was also a hard link to the root inode
in the tmp directory which shouldn't have been there (not including '..')
Fortunately they were all quite easy to patch up using the disk editor.
After patching them, the partition was useable so I made an immediate
full backup then ran fsck once more. There were some problems found,
but I just let fsck get on with it. (Couple of minor inode & directory
entry problems, plus the zone map had around 30000 errors!)

The filesystem came back up ok after all this so I carried on using it.
One thing I noticed was that the first file I tried to create after
fixing the filesystem returned an error. The file was in the directory,
but of zero size... Subsequent file creations worked ok, even repeating
the original failed request worked, and fsck reports a clean filesystem.

This whole problem of a currupt root inode has happened twice now in
the last few days, each time with similar symptoms (zone map errors,
1st file creation failed). Although the last time I wasn't running fsck.

I'm considering just 'mkfs'ing the partition & restoring from backup
but if this is a known problem with the MinixFs version I have, I'd
rather upgrade (if one is available) to a more stable version at the
same time.

Any suggestions?

Cheers, Steve

1833. Allocating memory in accessories...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-07 19:59:15 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Apr7.195915.5980@beaver.cs.washington.edu>
Source record: 33365

How do you allocate memory from an accessory on the fly? If you use the GEMDOS Malloc() and you're running an accessory from within a program, it associates that memory block with the program you're running at the time, and then frees it on program termination.

The only way I could think of is to have a buffer that you allocate upon loading the accessory, then dynamically allocate from this yourself. I would rather allocate the memory whenever I needed it.

Any suggestions?

1834. Latest gcc includes

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-07 20:05:12 UTC
From: sdenman@wolf.cs.washington.edu

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Can somebody please send me the latest includes for gcc.

This includes AESBIND.H with all the commands for AES 3.4 and above.

Also, does gmlibo30.zoo contain GEM libraries for these commands as
well. Commands from AES 3.4 include objc_sysvar(), appl_getinfo(),
and others.

Thanks,

Stuart Denman

>tell me what's going on here?

Since _shell_p is a system variable in the first 2K of RAM, you must be in
supervisor mode to access it. Too bad the default memory protection wasn't
to make those areas read-only in user mode; life would sure be a lot simpler.

1836. Falcon IDE drive question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-08 01:34:25 UTC
From: jeff@jupiter.Arizona.EDU
Message-ID: <2o2cb1$bbh@auggie.CCIT.Arizona.EDU>
Source record: 33367

Hi Atari Tech Gurus! Every few months I test the waters again to see if anyone has any thoughts to my Falcon problem. The dealer I bought the Falcon from has no idea how to fix it, and Atari's never heard of a problem like this, so I'm just hoping one of you Falcon owners out there can help me.

The problem is simple... Changing graphics resolutions on my desktop takes 25 seconds. This may not sound like much, but it's EXTREMELY annoying. In the past, people have pointed to my drive as the problem, but I've re-formatted it several times with no effect. The drive is not "spinning down", and is in fact not really being accessed, other than about 5 pulses roughly 4 seconds apart.

So I don't know what the problem is. Occasionally on trying to switch graphics modes, the Falcon either bombs out completely, or goes to a white screen in which typing produces key sounds, but that's all you can do. However, the occurance of these effects is well within the expected limits for Atari oddities.

Any ideas?

Thanks a bundle!
Jeff

1837. Atari 20meg SUPRA HD For Sale $100

Notator is not meant to run in colour and anyway it would be a bad idea as
the resolution is far too low for any score editing.

This is normal and has nothing to do with MinixFS. fsck locks the
drive with Dlock, and any current directories located on this drive
are then reset to the root directory by MiNT. I don't think that this
is the reason for trashing your root inode.

The figures RateHD gives are meaningless in my experience. The difference
between IDE and SCSI is very small. I know, I have both.

Just for the record, RateHD uses rwabs() I believe, bypassing the file
system. It also gives very strange results on the Falcon.

You've got to send them your original disk plus 8DM in stamps (german stamps, I'm afraid).
I've checked it at the CeBIT with Mr. OverScan himself.
He promised version 3.0zm does work under MiNT, but not yet under MultiTOS.
They are working on the MultiTOS version, which will be 3.1, and are going to send
update notes to the registered users then.

I think they would accept cash, too; try to get a 10DM-note at your bank
(I know they tend to charge rather steep fees for things like that).

And wait, they've got a new address!!!
Let me just look that up, I'll be back on Tuesday or something.

I _used_ to run Notator 3.1 on a colour monitor with a 4meg 1040 ST. Yes,
it would display properly, and work ok.... up to a point. Notator does
not print properly from a colour monitor, and never has. You will find
missing note heads dispersed throughout the music score.

The manual does not recommend using a colour monitor. In fact, when I
looked into the problem, I found that only by switching to a mono monitor
would the printing problem be resolved. So I did, and so it has....

If you already have a mono monitor, use *it* for Notator. It can all be
compared to using Pagestream or Calamus in colour on an 8mhz 1040 ST -
not so wonderful!

Uh, no it is nearly impossible that it is a pirated copy since Notator
uses a cartridge dongle (which I loathe and despise) and the program will
not run without it.
My Notator manual says that Notator works in color or mono - what
they don't tell you is that in color, everything is crammed and
overlapping; generally unpleasant to work with. After that, I realized
that I needed to buy a mono monitor.

Is the microphone port the only connection you have? It's the likely
cause of the noise, since it's at a very low level and will amplify
the noise that the computer generates.

If you have a pair of "Aux in" or similar connections (usually RCA sockets)
then use those direct from the MSTe and it should work as well as my
similar setup.

OK. I get 700 k/s on my Falcon IDE. That's a 65MB drive, I know there are
faster ones around. I get 1100 on a 210 SCSI Maxtor and 1600 on a 1GB
Fujitsu. All these figures are for reads, writing is slower.

2.5.8, the current version. Previous 2.5.x versions had problems
producing working 68k code on the Atari ('030 worked fine) due to an
optimiser bug.

On CIX we do, these Usenet messages come as uncompressed text and all CIX message base is uncompressed text. Ther is of course a compression option.

1859. NVRAM HELP!!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-09 19:49:09 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HAZ5T29T0I8WX2GB@SNYONEVA.CC.ONEONTA.EDU>
Source record: 33392

Hi all. I am guilty of stupidity - I played around with my Falcon's NVRAM settings and I've really screwed things up!

Ok, here's what happened:

In a desperate attempt to run a Falcon game which seem hardcoded to work in European PAL video, I changed my NSTC US video setting to PAL.
As I have an RGB monitor, my screen is now unreadable. The screen rolls vertically in an uncontrollable fashion. I have the proper NVRAM restoration program(s) but I can't read what's on my display...catch 22!

I was told that if I attach a VGA monitor to my Falcon I should be able to use it to make the necessary changes (i.e. see whay's on my screen!)

Question 1: Would such a method work? I don't have a VGA monitor but I know many people who do...

Question 2: Can I open up my Falcon and yank out the NVRAM battery like you can on PCs when settings go bad? If so, could someone tell me how to do this?

I'd appreciate any info here as this simple thing just renders my Falcon useless and I've got term papers and other things to do!

Thanks,

Ari

I can't speak for Australia, but for the U.S. and other countries following the Berne conventions, copyright lasts for the original author's life + 50 years. For computer software where the author is unknown, the term of protection is 75 years from date of publication (or 100 years from date of creation).

So, no, copyright doesn't run out in 7 years. But look for it on an ftp site near you, in 2060 AD. ;-)

Yes, and a lot faster too. Having to toggle Super, or go through SupExec
just to read a system memory location adds a lot of extra overhead, up
to 100x overhead! when there's a few TSRs chained into the system vectors.

I've gotten the ICD Pro Utilities version 6.4.3 up and running on my Falcon. Appears to be in good shape - just as you would expect.

I've also spoken with ICD the other day. They will be coming out with a CD-ROM reader that will work on the Falcon very shortly.

If you are trying to call ICD, you should realize that technical support for Atari is only provided Mon, Wed, and Fri from 10am - 2pm CDT (Central Daylight Time). When you reach them and talk with them, you will find Howd Peters very knowledgable. Wayne

>(I know they tend to charge rather steep fees for things like that).

All what you state is ilegal here and we don't sell German stamps here,
this is New Zealand...:-)

Why not do the Upgrade the same way that GSZRZ (Michael Ziegler) does,
you log onto a presdecribed BBS and dnload the Update, this I have just
done for my Old version of GSZRZ and it worked 100%....

Also how does one go about changing registration, my one is a second hand one,
but was never installed, the user had a STE, I never found a registration card.
..??

May be its about time that Germany uses BankCards, a far easyer way to get
money overseas...

So if any one here buys Auto Overscan, there is no easy way for him to updated
it.....

Come on you Germans let get with it, its 1994 not 1930...!!!

If Michael Ziegler can do so can you.....

It would, but you will need the VGA adaptor (about 10-15 US$). You may
actually like your Falcon with a VGA - better resolutions.

Something else you can do is adjust the vertical hold on your
monitor (and then adjust it back when you get it back into NTSC
mode). I'm lucky... my SC1224 syncs to NTSC or PAL signals by
itself!

1870. Re: Allocating memory in accessories...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-10 12:48:35 UTC
From: gutschk@jacquard.world
Message-ID: <GUTSCHK.94Apr10144835@jacquard.world>
Source record: 33403

If you want to allocate memory dynamically you can make use of a *dirty* trick.
Beware, Atari documented this trick to be illegal, so you should only use it,
if the OS version number is less or equal 4.04 and this is a single tasking
OS (under these circumstances, the trick ought to work fine). If the program
has been started from MTOS, you can allocated memory without bothering about
ownership. I do not know, about how to deal with Magix and Genava, so maybe
somebody else can help with that information.

What you need do is to find the address of the act_pd pointer. In TOS
1.00 this was at $602C (except for Spanish TOS, which had $873C),
newer TOS versions supply the address in the ROM-header. You will then have
to save the value stored in this vector, set the vector to point to your
basepage address, call Malloc (or malloc() if you want to), and restore
the vector. This procedure is also neccessary for handling file I/O!
Please pay attention not to call AES while the vector has been changed!

Markus

1871. Re: NVRAM HELP!!! (Thanks)

Source record: 33404

Thanks for the quick responses to my question...

I have a late model SC1224 display attached to my Falcon and it apparently seems unable to cope with the 50hz refresh rate that the NVRAM PAL setting created...

I understand that this problem affects only some models of Atari RGB displays as I have a Magnavox 1CM-135 RGB display attached to my STE at home at it seems to properly adjust to 50hz settings (my original SC1224 was unstable at 50HZ but as bad as my newer one!)

SO, the concensus appears to be that if I attach an ordinary VGA monitor, I should be able to fix things on my system...

I have since ordered the proper adapter and will try it with a friend's VGA monitor as soon as I receive the package...

Yes, one of the first things I tried was to adjust the vertical hold of my display. However, this didn't seem to do very much (at least on my system).

Thnaks again and I will let you all know if its fixed!

Ari

My last post had two mistakes in it. I should have said
#include "common.h" not <common.h>. Also, the opcode for appl_getinfo
is 0x82 not 82. appl_getinfo is NOT morally equivalent to scrp_clear!

No. This mode has been removed (take a look at the MiNT source).

It's worth a try, surprised your RGB monitor couldn't handle PAL frequencies though.

>Question 2: Can I open up my Falcon and yank out the NVRAM battery like
>you can on PCs when settings go bad? If so, could someone tell me
>how to do this?

Not so easy, I believe the nvram is built-in to the Dallas clock module, only way to get that out is by de-soldering.

You could also try connecting to a modern TV. Some sets can handle both NTSC and PAL frequencies.

BTW, if you cannot get a synchronised picture on your monitor or TV, then turn it off to reduce any risk of damage.

From: warwick@cs.uq.oz.au
Message-ID: <2oa7bu$msl@uqcspe.cs.uq.oz.au>
Source record: 33409

```
XIMG
+ Supports all resolutions
+ Converts well to VDI format
+ Fast
- Not used outside Atari community

GIF
+ Widespread use outside Atari community
- Slow
- Max 256 colours

JPEG
+ Supports all resolutions
+ Excellent compression
- Slow
- Lossy

TIFF
+ Supports all resolutions
? Hard to code

Comments?

Personally, I use XIMG for everything Atari-related and GIF for showing
to a wider audience, except for truecolour images which I send in TIFF.

For purposes of memory allocation, Geneva works the same as MultiTOS.
Geneva is basically a complete AES replacement that emulates AES 4.x,
adds its unique features, and leaves the VDI and TOS alone.

Since changing resolutions causes desk accessories to be reloaded, that
could be why it takes so long (perhaps some of the desk accessories you
use are taking up all the time being re-initialised).

To upload a file to comp.binaries.atari.st or comp.sources.atari.st you
should send your submission to avg@cwi.nl where the moderator will look
at it, make sure it works, and post it. I think the archive needs to be
a ZOO archive, though, and the UUEncoded pieces should be no larger than
45K.

If any of this is wrong, I'm sure someone will correct me.

[> I require a macro assembler for a 68K ST. It should produce standard DRI
[> or GNU format object files. I want Motorola syntax, and not MIT syntax.
[> I do NOT see any reason why something as simple as an assembler should
[> modify any vectors or use any illegal programming.

I have two suggestions: MadMac, and DevPac.

MadMac comes with the Atari developer kit. It has documentation, but
nothing fantastic. It is a TTP program, and barely does any output
anyway, so you should be able to use it with TOSWIN. On the other
hand, it is quite old and probably does not support the 68020 (and
above) command set.

DevPac is newer, faster, better, and cheaper. It came on a magazine
disk some time ago (DevPac 2) but I do not know which one anymore.
It does support the new command sets, but it has a built-in editor,
which you said you HATED...:) The editor is like Tempus, apparently,
and is rich in features. If worse came to worse, you could just use
VI to write your code and then load it into the assembler and go
from there.

[> If worst comes to worst I'll get Sozobon C and use it's Assembler! I heard
[> of an version of gcc-as that works with Motorola syntax. If you have it,
[> please Email it to me. If you know of a good macro assembler, please tell
[> me where to find it - but no GFA BASIC crap!

Please keep in mind that Turbo assember was written quite some time ago.
There was no Falcon, or MultiTOS, so it was not written with these
things in mind. It is actually a very good assember, I've been told.
I'm not an assembly programmer, though, so I cannot say for sure.

You're sure this still works? Have heard it did some versions ago, but was
removed in the meantime, and highly undocumented anyway.

I have a *very* vague idea that you might be able to force PAL (or NSCT)
mode by holding down some key at bootup. Now where did I get that idea?
In the docs for that German VRAM-fiddling util perhaps?

BTW have you tried asking Atari, or the people at STFormat?

1885. [HELP] Bug in VIEWER.APP & Gulam on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-11 11:33:53 UTC
From: jhh@cwi.nl
Message-ID: <Co3EsH.Ftn@cwi.nl>
Source record: 33417

Hi,

Does anyone know how to treat (circumvent, or whatever) the following two bugs?

1. If lines longer than the width of the screen are being output by a command
executed from Gulam, each spillover character is output on single line like
t
h
i
s
.
This happens when I boot my Falcon without MultiTos running.

2. If I do use MultiTos, and want to show a file with VIEWER.APP, I get
an empty window with the VIEWER-icon in the middle and a transparent
window status line (i.e. the line just below the window title).
Clicking the scrollbars sometimes shows me part of the text to be
shown, but with truncated characters. It seems as if VIEWER.APP thinks the
upper-left corner of its window is always located at the upper-left corner,
because if I move the window to that position it will show me most of the
text (provided I scroll it first).

I have a 4Mb/85Mb TOS 4.01 Falcon with SVGA, usually operating in 16 colour
mode, and FPATCH2 installed.

Thanks,

Jaap-Henk

It works fine on my TT with NVDI. Perhaps your should get a less buggy
version of the Falcon TOS, eg 4.04

>Sheesh ... even this little UUCP site compresses my mail .. ;)
We have a compressed option but most of us choose not to use it as it is
faster to download uncompressed text files at 38400 cps or above (and
allowing for the compression time).
Those ST users at 19200 use compression files.

Yesterday the root directory of my harddisk was trashed for the second
time in a month. Both times, the directory had become overwritten
by temporary files (from elvis and bison actually) that are normally
to be created in $TMPDIR (not in the root directory anyway :-).
I don't know whether it is related, but it started after having upgraded
Gemini to Gemini 1.99.

I wonder, how does Gemini treat $TMPDIR/$TEMP and what is the special
meaning of TRASHDIR? (I saw a variable with that name defined in one
of the profiles, but noticed also a directory TRASHDIR, possibly hidden,
in the trashed root directory.
Does Gemini have any known bugs that may have this effect?

Marc

Green Card Lottery 1994 May Be The Last One!
THE DEADLINE HAS BEEN ANNOUNCED.

The Green Card Lottery is a completely legal program giving away a certain annual allotment of Green Cards to persons born in certain countries. The lottery program was scheduled to continue on a permanent basis. However, recently, Senator Alan J Simpson introduced a bill into the U. S. Congress which could end any future lotteries. THE 1994 LOTTERY IS SCHEDULED TO TAKE PLACE SOON, BUT IT MAY BE THE VERY LAST ONE.

PERSONS BORN IN MOST COUNTRIES QUALIFY, MANY FOR FIRST TIME.

The only countries NOT qualifying are: Mexico; India; P.R. China; Taiwan, Philippines, North Korea, Canada, United Kingdom (except Northern Ireland), Jamaica, Domican Republic, El Salvador and Vietnam.

Lottery registration will take place soon. 55,000 Green Cards will be given to those who register correctly. NO JOB IS REQUIRED.

THERE IS A STRICT JUNE DEADLINE. THE TIME TO START IS NOW!!

For FREE information via Email, send request to cslaw@indirect.com

Date: 1994-04-12 08:40:55 UTC
From: mbdqbest@horus.sara.nl
Message-ID: <1994Apr12.094055.4605@news.sara.nl>
Source record: 33426

I try to set the jumpers for a TEAC FD-235-HF (4240-45) floppy drive 1.44 MB.
Who knows the right settings for Atari ST?

```
(power)
A B C D E

2 o o o o o
1 o o o o o
```

I have set 2AB and 2DE but DD disksave is not recognised. (HD works ok.)

>it connects to the internal buss....

It *is* connected to the CPU. And you get more than 1MB/s with the
right drive. This is fact (measured by reading the full disk, 240 MB,
and dividing by the time needeed for that).

I use Wercs from Hisoft, it's not bad - it just about does the job but it is
a bit slow and there are ways to crash it.

No, but one thing I was wondering about. Playing samples on a pre STE
machine takes processor time right? How about this (it's only an idea)
tkae the sample playback code and after the sound chip data has been
calculated, instead of sending it to the sound chip, store it in a
table - and then to disk. Now, when it is memory, would you be able to
use this data to play samples in the background, i.e. would you be
able to use this method to 'convert' samples to sound chip data that
can be played in the background. By sound chip data I mean the tunes
that really grate on the ears.

An interesting idea methinks.

Hello

There was a thread recently about viewing jpegs on an ST, and someone replied
that they could convert jpegs into gif format before viewing with Photochrome.

Well, if anyone was wondering where to get a conversion utility, then you can
can anonymous ftp it from micros.hensa.ac.uk

path to directory: micros/atari/tos/n/n070/<files>

Enjoy

1898. Falcon & GFA's HARDCOPY command

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-12 14:16:49 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9404121340.AA00443@ilmen.lanl.gov>
Source record: 33431
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Someone recently told me that GFA BASIC's HARDCOPY command (the built-in screendump that makes an XBIOS(20) call) doesn't work on the Falcon. Since my old Epson printer is temporarily out of commission I am unable to double-check on this. I'm aware that HARDCOPY or the ALT-HELP built-in screendump only works in ST compatability modes and only on Epson compatible printers.

Could someone please confirm (or deny) this for me and let me know?

Thanks!

there is a program that does this (sort of). it's called mcompile--for
mod compile. problem is that it takes a lot of memory and time to do it.

i stopped playing with it when it took ten minutes to compile a mod i had and then ran out of memory (on a four meg machine), erasing everything it has done... oh well...

nice idea tho...

1900. Problem changing screen address in VBL interrupt

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-12 16:21:06 UTC
From: woodford@esca.com
Message-ID: <1994Apr12.162106.12315@esca.com>
Source record: 33433

Ok all you game writing gurus, this should be an easy one...

I'm writing an ST game which uses double buffered screen memory,
ie. one screen on display, the other being updated.

I have an assembly routine hooked directly into the VBL interrupt
vector at 0x0070 which checks a flag in a variable global to
my program and if it's non-zero, loads the hardware at 0xff820[13]
with the address of the screen to be displayed. It then zeroes
the flag to signal my main software loop that the screen memory
has been swapped and that it's safe to update the other screen.

However, it appears that the new screen is not displayed until
after the *next* VBL, resulting in flickering sprites since my
main loop erases sprites which are still on screen!

If I make a few changes so that I'm using triple buffered screen
memory (ie. one on display, one updated ready to go on display,
another being updated) everything works fine. I can easily sustain
60 frames per second with >20 12x12 bit sprites this way, but
triple buffering is a bit more of a pain, not to mention memory
hog, than double buffering...

So, why won't the hardware use the new address immediately? Is my
VBL routine being pre-empted by an MFP interrupt before loading
the hardware? (I know, I should try disabling the MFP interrupts)
Or should I load the hardware with the screen address at some
other time, perhaps on the last Hblank?

Come on guys, I'm sure this is an old problem which has long been
overcome!

Cheers, Steve

Why do you ask questions if you know the answer? You just have to set
the screenadress one VBL before you want the screen to be seen.

> So, why won't the hardware use the new address immediately? Is my

The VBL is called when the vertical blank is done, so displaying of the screen
has begun.

> VBL routine being pre-empted by an MFP interrupt before loading
> the hardware? (I know, I should try disabling the MFP interrupts)
> Or should I load the hardware with the screen address at some

This is possible, but actually far too complicated for just switching
screen-adresses.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

In regards to my earlier post about the screendump XBIOS(20) call not working properly on the Falcon, I've found out it only fails in ST Low Resolution mode. ST High and Medium res work fine as I thought. Since I never program apps in ST Low, I didn't know about the screendump failure in that resolution.

Does anyone have a routine that could be incorporated that WILL do a standard screendump in ST Low on a Falcon? My friend is using GFA so that's preferred but of course C or Assembly executable is OK as that can be embedded.

Thanks!

The LAN port in the Falcon is just BIOS device number 8. You can use Bconin
and Bconout to dev 8 to push data thru it.

If you want to adjust the settings using Rsconf, you'll need to use Bconmap,
and you'll need to have a fixed Bconmap for everything to work. FPATCH2 ought
to do the trick for you.

1905. Porting Word Writer Files to Mac and/or MS-DOS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-13 03:47:07 UTC
From: rrosenberg@aol.com
Message-ID: <2ofpvr$nam@search01.news.aol.com>
Source record: 33292

I am posting this as a favor for a friend with an Atari ST who uses Word Writer, published (and apparently subsequently orphaned) by Timeworks, as her Word Processing Program.

She wants to port a number of large and complex Word Writer created Word Processing files to the Mac Platform (although going to IBM MS-DOS is adequate since the Mac can finish the port by reading MS-DOS media and doing the Conversion from a PC WP-Format Document to a Mac WP Document).

Since it is my understanding that the physical formatting of ST formatted 3.5s is not compatible with either Mac or MS-DOS, the actual transfer of files would be done via a CPU to CPU link (either via Null Modems or doing an Upload/Download [or EMAIL] transmission via a Computer Network). BTW: If the disks _are_ physically readable (including the directory structures) by an MS-DOS machine (or the ST can format/create either MS-DOS or Mac disks [without any extra hardware like an emulator card <g>]), I'd appreciate hearing this.

The major stumbling block to accomplishing the porting is that, to my knowledge, Word Writer does not use (or has the ability to create) a file that is usable by any IBM Word Processing Programs (nor can it create RTF transfer format text files [which is one way to transfer formatted WP documents between WPs who can not read each other's native formats and which do not share any common native formats that can be written/read]). Are there any conversion programs that can run on the ST that will read WW files and output RTF, MS-DOS or Mac format WP files? If so, where can I locate the program. Note that just creating Text (ASCII) files is _not_ a viable option since that loses all Formatting (Headings, Centering, etc) as well as Styling (bold, italic, underlining, etc).

Thank you.

NOTE: Please send EMAIL (if any) to my Internet address: hal9001@panix.com. Thank you.

Didn't see that bug, because I don't use VIEWER.APP. But I know there
were some bugs in earlier VIEWER.APP's which were fixed in sperate,
free releases later.

1908. [HELP] Falcon Bugs (VT52)??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-13 07:23:39 UTC
From: jhh@cwi.nl
Message-ID: <Co6sJF.5qy@cwi.nl>
Source record: 33440
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Are there any patches for the following three bugs?

1. The VT52 Escape sequences "\033j" for save position and "\033k" for restore position do not seem to work. Whatever I do, restore position puts me at (0,0) = (upper-left). According to the documentation it is only allowed to do so if no position was saved previously.

2. If lines longer than the width of the screen are being output by a command executed from Gulam, each spillover character is output on single line like
t
h
i
s
.
This happens when I boot my Falcon without MultiTos running.

3. If I do use MultiTos, and want to show a file with VIEWER.APP, I get an empty window with the VIEWER-icon in the middle and a transparent window status line (i.e. the line just below the window title). Clicking the scrollbars sometimes shows me part of the text to be shown, but with truncated characters. It seems as if VIEWER.APP thinks the upper-left corner of its window is always located at the upper-left corner, because if I move the window to that position it will show me most of the text (provided I scroll it first).

I have a 4Mb/85Mb TOS 4.01 Falcon with SVGA, usually operating in 16 colour mode, and FPATCH2 installed.

Thanks,

Jaap-Henk

I think that the NVRAM archive on a.a contains an autofolder program that
resets the NVRAM to a reasonable state. Get it, create an auto folder and boot
with that in the drive. (You might also have to supress HD boot, I don't
remember). Ask some friend who also has an atari to do it for you.

Don't feel stupid. I did it myself the first day that I got my falcon.
I changed the settings (because I thougth I pressed cancel and it was really
OK - stupid software). And I didn't know it until I rebooted some hours later.
Took me a few hours just to figure out what had happened. Fortunately I still
have my old Mega ST, so I was able to set up that disk.

otherwise...

Hi,

I'm considering the purchase of a Maxtor 7345S for use on my Mega STe
with the built-in Atari host adapter.

I have a choice of either Atari HDX, or possibly ICD's newest
utilities to prepare the drive and mount the hard disk driver.

Question: I haven't actually used ICD's software on an Atari host,
will this work successfully and will all features of the software be
available?

Second question: will the Maxtor hard disk be recognized by either
hard disk software, or will I have to manually enter the specs of the
drive in the drive table?

Thanks for any replies, this will save me quite a bit of money if I
were to purchase the drive and find it doesn't work!

Duh, don't use a VBL.

Why set a variable, that sets a pointer that does something else?
That sounds like a rube golberg type of thing.
Do it directly when you are done.

Its very simple:
...

```
while(running)
{
drawscreen();
pageflip();
dojoystick();
checkkeyboard();
}
```
...

```

Hello everybody !

I'd like to install GNU C compiler on my Falcon 030, but I can't find any where
a complete version... The gcc258b(etc) just contains the main executables, I uploaded
the libraries and include from archive.umcih.edu BUT I didn't find the executable
"gcc-ld.ttp" (the linker !) and I don't think do many things without it !

Could someone tell me where/how I could get it please ?

CKO (olivier)

> (The HTML widget should derive fairly easily from the GEMcanvas class of GEM++)

But, as you said in email, it looks like hellish amounts of work. Maybe
we should just start implementing an HTML class from scratch... we can
start with inline .IMG support and Atari sample support, and add more
standard things (ex, inline .GIF/JPEG, .AU samples) later.

I'm in favour of this because if we've got an HTML widget, we've got
instant online help with hypertext that's _standard_ on the Internet...
even if we can't support links to other machines, links within documents
or to other local documents would be very handy.

Portable (Bit/Grey/Pix) Map (pbm, pgm, ppm) opens a whole world of possibility for UNIXen, TARGA is a faily simple and wide-spread 24-bit format (but with no compression). You've probably got enough RAM in your TT to successfully compile the TIFF library in PBM-Plus and/or NetPBM; that would probably help your TIFF problems (it'd take the pain out of "hard to code" at least).

Lots of DOS/Windows programs have problems (SEVER problems) reading and writing conforming TIFF files. That platform seems to have this huge ego that everyone else should be compatible with _them_ instead of following the established standards...

1920. Assembler

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-14 04:08:52 UTC
From: ekl@sdf.lonestar.org
Message-ID: <Co8E6u.CH9@sdf.lonestar.org>
Source record: 33301

Help. I need a good assembler for what I am about to undertake.
The GCC-AS does NOT follow Motorola syntax (at least not the one on a.a.u.e,
if you have one that will give me Motorola syntax, uuencode it and cough it
up - mail ekl@sdf.lonestar.org). Also, how does one either get the assembly
source to interface to the start-up code or just produce an executable
withoput start-up code? Sample assembler source please! I have a small
test file in MIT syntax that GCC loved but the executable crashed, and I
assume I'm doing things right.

GDB doesn't recognize symbols and lately it just crashed when run. Has
anyone fixed GDB to work with the standard symbol tables so all Ihave to
do is say "gdb myprog.tos" and have it go?

Anyone have another debugger - even if it isn't symbolic, a plain assembler
debugger (should work with MiNT please! although that is not an absolute
requirement)??

OK, anyone have the Turbo Assembler they can email me (BART doesn't like me
anymore I guess - netquirk problems)? Can Turbo Assembler produce DRI
object code as well as standard TOS executables?? Any docs??

Any help appreciated. I really do need an assembler for what I'm going to
do and I'd hate to have to write one in C.

1921. Memory types

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-14 04:46:49 UTC
From: ekl@sdf.lonestar.org
Message-ID: <Co8Fy2.Ctt@sdf.lonestar.org>
Source record: 33302

Will I be violating any rules by Malloc'ing a block of memory and then loading code into it? MiNT, the PMMU, or the 680x0 won't care if I execute code from an area that should be just data will it?

I'm operating under the assumption that it won't matter, so I'd like to be able to make "tables" of assembler code. Basically, I'll either Malloc the room for the table or use MiNT's SHM system (the table index's will be built at run time using a table of offsets, so that will bypass the pointer problem of SHM). What assembler pseudo-ops can I use to tell the assembler to not include any start-up or object-file header info. I just want it to assemble with labels being relative to offset 0 (so the labels will be my index pointers that I can put into a table). Also, how do I take the label values from multiple source files and put them in a table in another file?

I think I may be writting my own tools for this :-)

****
ATTENTION: ALL GAME PROGRAMMERS
****

*** SOFTWARE DEVELOPER'S KIT ANNOUNCEMENT ***

Available immediately: software developer's kit for a new joystick code-named 'C4'.

The 'C4' joystick has the following features:

o For use on all the following computers and game systems:
(specific cable required)
- IBM PC and compatibles
- Super Nintendo/Super Famicom
- Sega Genesis/Megadrive
- Macintosh with Apple Desktop Bus
- Amiga

- CD32
- Nintendo Entertainment System 8-bit
- Sega Master System
- AppleIIGS
- Atari
- Commodore 64
o Eight-button mode available on all platforms.
o Standard arcade size buttons in a compact arcade style
case.
o High strength steel shaft, with interchangeable handles.
o LCD display for button feedback, game messages, and
programming.
o Five year warranty.
o High precision and sensitivity.
o Special sensor technologies; no contacts to wear out on
primary components.
o Fully programmable.
- Turbo, slow, and custom modes available.
- Adjustable deadzone for rock-steady precision centering.
- Hundreds of presets available for the most popular
games.
o Selectable analog, digital, and other modes.
o Retains settings in non-volatile memory; no batteries
required.

At product release, the 'C4' will be available for an MSRP of
$99.95 and the developer's kit will be available for an MSRP of
$199.95.

SPECIAL SDK INTRODUCTORY PRICE FOR DEVELOPERS

A special pre-release offer is available to qualified developers.
This special offer includes the SDK and beta version of the 'C4'
joystick for $69.95. This price includes intermediate SDK
upgrades and a joystick upgrade to the production release.

To determine your eligibility for the SDK, please fill out the
following application, and return the completed form to:
sdk@c3i.com

Please include your e-mail address:

1924. Mag!cs vers Geneva

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-14 12:28:52 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <2ojcu4$87@golem.wcc.govt.nz>
Source record: 33305
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been told the way to go is Mag!cs or what ever its called..

How does this stack up with Geneva, compatiblity with older software,
how much ram used etc...

What sort of support will I get here in New Zealand, and what will it cost me..

Can I buy it by Credit Card, etc..??

The other things are what type of DeskTop shell will I need, Please don't say
Gemini, I am fed up with half baked Translation of German programs, plus
I have never liked Gemini...

I still use Neodesk, will it work 100% with it and support all its features..??

No I don't wish to spash out hard earnt money just to fing I have been conned
like I have with Auto Overscan, with no support..

There is very little support for most German programs out side Germany,
so who will support Mag!cs...???

If its a good USA firm it will get my 100% attention, but if not silch...

I have yet to find a UK firm that support there users, or does not go belly
up..

With Neodesk and Geneva I get full support on GEnie, were would the update
support come for Mag!cs..??

A BBS may be, like GRSRZ has or even GEnie, or even a good FTP site, that
works like GSZRZ does.....??

All food for thought...???

Can any one answer these questions..??

Gemini only uses $TMPDIR for temp files (this is the POSIX way). $THRASHDIR can be used to preset the trashcan path.

I've never heard of Gemini 1.99 thrashing disks. It's unlikelz, because Gemini only uses GEMDOS calls to access disks.

Uhhh, does being `completely legal' imply that it doesn't use line-a
calls? It should run on a falcon, then, or with a third-party video card,
right?

1929. Changing Screen address during VBL (Doesn' work)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-14 16:09:21 UTC
From: woodford@esca.com
Message-ID: <1994Apr14.160921.18497@esca.com>
Source record: 33313

Well, with the help of fellow netters, (esp. Frans Meulenbroeks)
I solved the problem I mentioned in an earlier post.

Basically, you can't set the address of the next screen to be
displayed from within a VBL routine since the hardware has already
pre-loaded the address _before_ the VBL interrupt is raised.

The VBL can only be used to syncronise with the hardware _after_
writing the address to hardware at some other arbitrary time.

But then you all knew that anyway! ;-}

Cheers, Steve

You will have to get ICD pro utilities if you don't have an
ICD adapter. I have a maxtor drive on mine, and the ICD
FORMATTER listed a lot of Maxtor drives. My use with ICD
has been great. That is what I would recommend.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Well my Falcon is down for repairs, so I find myself with a litle free time. So I've decided to try to put it to some use.

I am looking for submissions, sugestions or pointers for a SLIP FAQ for the Atari 16/32 bit computers. I am fairly fluent in both french and german so if you don't feel comfortable with english, you can use one of these. I would also be interested in people willing to do a translation of this FAQ to their native language.

So PLEASE, if you have any info on software, tips, tricks or etc. Please mail me and let me know. If you are a (semi)expert on this please mail me and make yourself available for stupid questions. Remember stupid questions you answer now are ones you can avoid in the future. Hopefully we can come up with something that will be helpful to all.

Thanks,

Dan Ackerman

The linker, as well as other goodies such as strip, printstk and
fixstk are in the Utilities directory in an archive called
utlbinxx.zoo (where xx is actually a number, I think I use the
stuff from utlbin37.zoo).
Generally, gcc gets the more useful the more Unix-like your
environment is, therefore you might want to get a Unix-flavor
shell from Mint/Shells (I use tcsh). You'll need the file
utilities (ls, cp, rm & friends) in order to make the shell
useful. For projects of any appreciable size you also need GNU
make, which is in some subdirectory of the Gnu (or Gnustuff?)
directory.

1933. Joystick Beta-test Program

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-15 04:19:15 UTC
From: sdk@vanbc.wimsey.com
Message-ID: <2ol4k3$ksr@vanbc.wimsey.com>
Source record: 33316

```
****************************************
ATTENTION: ALL GAME PLAYERS AND PROGRAMMERS
****************************************

For information on a Beta Test program and Software Developer's
Kit program for a new joystick, please send your email return
address to: sdk@c3i.com

Please indicate which program you want information on.

The joystick has the following features:

o For use on all the following computers and game systems:
(specific cable required)
- IBM PC and compatibles
- Super Nintendo/Super Famicom
- Sega Genesis/Megadrive
- Macintosh with Apple Desktop Bus
- Amiga
- CD32
- Nintendo Entertainment System 8-bit
- Sega Master System
- AppleIIGS
- Atari
- Commodore 64
o Eight-button mode available on all platforms.
o Standard arcade size buttons in a compact arcade style
case.
o High strength steel shaft, with interchangeable handles.
o LCD display for button feedback, game messages, and
programming.
o Five year warranty.
o High precision and sensitivity.
o Special sensor technologies; no contacts to wear out on
primary components.
o Fully programmable.
- Turbo, slow, and custom modes available.
- Adjustable deadzone for rock-steady precision centering.
- Hundreds of presets available for the most popular
games.
o Selectable analog, digital, and other modes.
o Retains settings in non-volatile memory; no batteries
required.

Thank you in advance.
```

Jeremy McDonald
VP of Product Development
C3I Precision Instruments

P.S.
Thank you to all who have already applied for the software developer's kit. The software developer's kit offer remains the same, and due to exceptional demand by game players to take part in a beta test program as well, we have put together the beta test offer.

1934. ORCS availability

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-15 04:38:29 UTC
From: jbeeghly@u.washington.edu
Message-ID: <2ol5o5$72n@news.u.washington.edu>
Source record: 33317

A while back I posted a question asking about the status of ORCS, and someone replied that ORCS is now a commercial application. I would like to know:

1) Is there a demo of the new ORCS up on the net? If not, and if one exists, could someone plese u/l it? I would really like to see what has changed.

2) Is the commercial version of ORCS really Interface (by Shift, Imported into the states by Gribnif)? Interface and ORCS have quite a bit in common...

3) Where could one purchase the new version of ORCS?

4) Does the Author (Otto) reside on the internet? I'd love to ask him some questions....

Over here in the states we don't get much world on what's new in the Atari world, so please forgive me if all of my questions are common knowledge.

Ian Brown# (g051@cpcw8.uea.ac.uk) wrote:

: Does anybody out there have Unix and XWin running on their Atari?
: How would I go about getting it?

I have Minix running on my system....this is not a full implementation of UNIX
as we now know it, but an implementation of and old version of UNIX(v7).
However, it is fine to use, and learn about UNIX with.

There are UNIX tools available for the ST in the public domain, which can be
used with the desktop, but you really need a shell/cli which are also available.
And with MiNT available in the PD too, you have a type of UNIX box in you ST.

As for XWin, someone is supposed to be porting one over......however, some
problems with memory management, and sockets on the plain 68000. There is
supposed to be one available for the ST though, albeit quite expensive. I think
it is mentioned in the hardware FAQ for this newsgroup. The address is also
mentioned.

Hope this helps.

Danny.

Source record: 33319
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There is a major bug in the Falcon's console output, in that any output wrapping round the end of the last line on the screen causes it to forget to do the carriage return. I haven't used MultiTos much, but if I remember rightly this bug is fixed for it.

As far as I've seen, save/restore cursor still work. Remember, some of the other escape sequences use save/restore, and may disturb stored values. This may also occur if you cause the screen to scroll while the position is saved.

Source record: 33320

Use your swap screen, then immediately wait for a VBL. This will solve all your synchronisation problems and give you the maximum possible frame rate.

And about the 'who uses TOS anyway'... I do, the game I've been working on (for much too long now) is almost entirely O/S legal, because 1. it means your game coexists much better with your development environment, i.e. if it crashes you don't have to reboot, 2. my game is Falcon-compatible, 3. it's far more likely to carry on working in the future, unlike far too many games and demos programmed by idiots who reckon UNNECESSARY use of hardware registers and little CPU or hardware tricks are a good idea, and 4. it's a lot simpler, more robust, and easier to understand.

The same goes for my JPEG viewer, there's only a couple of things I have to go around TOS for, and all of those can be turned off to guarantee future compatibility.

>main loop erases sprites which are still on screen!

This is because the VBL interrupt occurs at the time of the vertical blank!
At this time, the start address of video memory has been read by the shifter
chip, so you wouldn't expect any change to take effect until the next VBL.

It seems that you expect the VBL interrupt to occur *just before* the VBL.

With this in mind, all you have to do is invert the logic of your screen
swapping routine to get rid of the flickering.

I don't get that bug in VIEWER.APP, but my copy doesn't appear to draw
8-bit characters properly -- they are drawn corrupted (random pixels,
actually).

My copy came with MulTOS 1.04/AES 4.00 from Hisoft. Where do you get
the (free) updates?

I have a feeling that SetScreen will not return until a VBL
has occurred anyway, so your Vsync() is unnecessary.

Nope. There is a system variable to set a new screen in the VBL
vector but it is not used by the XBIOS. Even if you place a new
screen in this vector, you have to wait for the next VBL before it
gets set since the vector is executed afterwards.

>that really grate on the ears.

Most games which use 'samples' already implement this idea of playing
them in the background from a table like you describe. The problem is
the rate at which the CPU has to write data to the sound chip. Even at
slow sample rates, say 8KHz, the CPU has to update the sound chip 8000
times a second! Believe me, doing this on interrupts soaks up serious
CPU bandwidth, I speak from experience here! Sample rates lower than
8KHz would grate on your ears even more!

Cheers, Steve

Well, I've relented to the unyielding pressure of fellow netters, and
I am now using Setscreen & Vsync to implement screen swapping :-/
This is mainly due to the points raised above. I reserve the right,
however, to hack the hardware if I run out of CPU bandwidth!

Cheers, Steve

Eek! What have I started?!

Cheers, Steve

1947. Re: Gemini and TRASHDIR

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-15 19:55:00 UTC
From: Stefan_Damerau@sl.maus.de
Message-ID: <199404152155.a65380@sl.maus.de>
Source record: 33329

In article marc@targon.UUCP (Marc Dierikx) writes:

MD>I wonder, how does Gemini treat $TMPDIR/$TEMP and what is the special
MD>meaning of TRASHDIR? (I saw a variable with that name defined in one
MD>of the profiles, but noticed also a directory TRASHDIR, possibly
MD>hidden,
MD>in the trashed root directory.

Well, The Environment variable named $TRASHDIR shows the path of the Folder in
which the files are moved if you drag them on the trashcan icon (not the
shredder which works like the trashcan on the normal desktop)

My profile.mup looks like this about ist:

```
++++++++++++++++++++++++
# Verzeichnis fï¿½r temporï¿½re Dateien/ Path for temporary files
setenv TRASHDIR "$GEMINIHOME\usr\temp"
setenv TMPDIR $TRASHDIR
setenv TEMP $TRASHDIR
++++++++++++++++++++++++
```

This way all files dragged on the trahscan are moved in this folder and apps
using the $TMPDIR, $TEMP (or maybe $TRASHDIR) put their temporary files in
there too.

One important thing may be:
If there's not enough space on the partition of the $TEMP it MAY cause problems
(dunno about it ...)

MD>Does Gemini have any known bugs that may have this effect?
Which machine do you use? No problems here on my Falcon 4.04

Nope, you should be able to exchange floppies between PC's and Atari's.
I do this every other day with various PC's at work. The fat and directory
structure is compatible.

Best way to accomplish a disk interchange is to format the disk on the PC, as
some older TOS-versions do not create a correct DOZE format.

Newer Mac's should handle it as well. However you'll definetely need a little
piece of (Mac)-software to transfer the files to the Mac.

R>transfer of files would be done via a CPU to CPU link (either via Null
R>Modems or doing an Upload/Download [or EMAIL] transmission via a

1952. Spectre 3.0 and CPU accelerators with cache

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-15 20:20:00 UTC
From: wilko@idca.tds.philips.nl
Message-ID: <778@apdnews.idca.tds.philips.nl>
Source record: 33339
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has someone around there any experience with using Spectre on
a ST with CPU accelerator AND a cache? I have built the PAK/3
(with 68020/68881 (16Mc) and 32kb cache) from the German magazine C't.

Without the cache SPectre runs like a charm, with the cache on
Spectre upon entering Mac mode hangs the system, leaving a
random bit pattern on the bottom of the screen.

The speed difference is enough to warrant me persuing this further.

Any comments? Maybe Dave's listening again? (Welcome back BTW,
news about Spectre has been missed by a lot of people).

Wilko

>I have been told the way to go is Mag!cs or what ever its called..
It is [g], I have been using it now for few months and I find that is
very stable and runs most Atari software.
There are some problems with PD stuff which is not well written.

It works with the Auto Overscan and by now I have given up on software
that is not screen resolution independent, such as Protext, if I
wanted a PC I would have bought one. :-))

>How does this stack up with Geneva, compatiblity with older software,
>how much ram used etc...

It uses around 350K ram, I don't know how much Geniva uses with the
Shell included, no good quoting usage without a shell.

>What sort of support will I get here in New Zealand, and what will it cost me..
Well System Solutions is the UK distributor for Mag!x and the software
is properly supported.
The cost for upgrades will be a nominal fee of around £15 for minor
updates.
The present version of Mag!x works with Sts, STes, TTs but not
Falcons, the Falcon version is to be release sortly.

>Can I buy it by Credit Card, etc..??
Yes we do take CC.

>
>The other things are what type of DeskTop shell will I need, Please don't say
>Gemini, I am fed up with half baked Translation of German programs, plus
>I have never liked Gemini...

Mag!x has its on shell call Mag!x Desk, it is very good, has some
realy nice touches, such as unlimited number of Icons on desktop and
installed programs, additional program icons, additional file icons,
etc.

>I still use Neodesk, will it work 100% with it and support all its features..??
I don't really know, never like Neodesk and haven't tried, but it
should work.
We will be also selling a replacement desktop from Germany [g] called
Ease, this is very good, more flexible than the Mag!x desktop.

>No I don't wish to spash out hard earnt money just to fing I have been conned
>like I have with Auto Overscan, with no support..
No much to support with the Overscan, the software updates can be
obtain from us or from Compo.

>There is very little support for most German programs out side Germany,
>so who will support Mag!cs...???
We will. [g]

>With Neodesk and Geneva I get full support on GEnie, were would the update
>support come for Mag!cs..??
We are on Cix so you can always get through to me with any querries.

>A BBS may be, like GRSRZ has or even GEnie, or even a good FTP site, that
>works like GSZRZ does.....??
SS have a BBS running 24hrs and 14400, the number is; 081-299 3933

>All food for thought...???
Uhmm!

>Can any one answer these questions..??
I've tried. :-))

1954. Z85c30 SCC USART

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-16 01:13:21 UTC
From: <>
Message-ID: <2one3h$erv@mother.usf.edu>
Source record: 33334

I put these messages on GEnie, and I was wondering if anyone here could help.

I have been dinging around with the SCC for a while now with marginal success. I have a sequence of numbers that is sent to the SCC to initialize it, so I have been using that. In order to get baud rates higher than 19200, you have to set the chip to x1 mode, rather than the normal x16 clock mode. Well, in the process of figuring out the normal x16 rates, I discovered, that the values that the Falcon's BIOS gives to the chip are consistent with the PCLK signal being 8.0544mhz, NOT 8.0000mhz like we're told. This caused confusion, but in my tests, I would only have to try either to see what worked.

The next thing I did was to reset the chip with one change to the values being programmed into it. I set the chip to the x1 mode, instead of the x16 mode. I soon discovered that, using the formula for calculating the baudrate countdown values, the 8.whatever mhz signal does not allow me to hit any of the standard baud rates dead on. So when I set the closest value and tried to use the modem, it was apparent that the data rate was very wrong. Some times, I would get a rate that the modem would 'sort of' recognize, but when information came back from the modem at full tilt (I asked it 'at&v'), most of it came in garbled. Calculations also showed that the baudrates I was setting the chip to were only a few percent off, which is perfectly acceptable for async, and even 19200 and 9600 when the chip is in x16 mode are slightly off. This tells me that either x1 mode doesn't work, or that the PCLK rate that Atari says is being given to the chip is REALLY different.

Next, I'll be trying to use the RTxC signal being piped into the BR generator and see how that works. I want to avoid the TRxC signal since it can only be divided by 1, 16, 32, and 64. Ick.

Later......

OK... Just a minute a go, I made a few minor changes to my testing program. Instead of the PCLK, I connected the 3.672mhz RTxC clock in x16 mode to the baudrate generator. I was able to get baud rates with decent accuracy at up to 57600.

But then I put the chip in x1 mode and bye bye it went again.

The formula for calculating the timeconstant for baud rate is:

$$\frac{\text{clock frequency}}{(\text{bit rate}) * (\text{clock factor})} - 2$$

When I use the clock factor of 16, this works fine. When I use the clock factor of 1, it does not.

Given the data that's coming in, does anyone have any suggestions for a round-about way of determining if the baud rate is too fast or too slow? I know where I can find a device to measure the frequency coming out of the port, but taking my computer there would me most inconvenient. If I can find some that work correctly, then perhaps I can determine what's wrong with my use of that formula.

1955. PCS to GIF converter?

Some people have been having problems locating the pl10 test version. Well its on atari.archive now (but you may have more luck accessing it as msdos.archive.umich.edu). I've also just sent it to ftp.uni-muenster.de (though it may take a while to get moved to a public area).
Steve.
P.S. In case anyone missed my earlier post, the pl10 test version may fix the Falcon crashes (but don't bet on it).

1957. Assembler!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-16 07:01:50 UTC
From: ekl@sdf.lonestar.org
Message-ID: <CoCBJ3.8y1@sdf.lonestar.org>
Source record: 33337

I require a macro assembler for a 68K ST. It should produce standard DRI or GNU format object files. I want Motorola syntax, and not MIT syntax. I do NOT see any reason why something as simple as an assembler should modify any vectors or use any illegal programming.

DO NOT tell me about Turbo Assembler. I tried 3 or 4 assemblers and the docs were crap on all of them, and most worked best under TOSWIN, although none would give me any code before crashing (normally booting bare made MORE crashes). Turbo Assembler was said to be very good and it seemed to have good docs so i tried it. EVEN it's sample apps crashed!!

I don't want a built-in editor (I'll use vi thank you or any other editor I damn well feel like! I hate built-in editors, and Turbo Assembler was the worst. It LOOKED like GEM, but was really a mock-up and was very instable. You had to flip screens to get to desk accs!! I hate GFA BASIC and I hate Turbo Assembler. I wanna do work, not watch my machine freeze.

Now, I know there is a simple AS.TTP out there that will take Motorola syntax and crank out a DRI format object file. I prefer macro capability or else I'm gonna have to figure out how to use Perl or something.

If worst comes to worst I'll get Sozobon C and use it's Assembler! I heard of an version of gcc-as that works with Motorola syntax. If you have it, please Email it to me. If you know of a good macro assembler, please tell me where to find it - but no GFA BASIC crap!

1958. Upload in comp.binaries|sources.atari.st

1961. SLIP FAQ (Software List)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-16 21:22:00 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <199404162121.RAA21042@bottom.magnus.acs.ohio-state.edu>
Source record: 33194
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

As a start to the Atari SLIP FAQ, I have prepared a preliminary list of software available for the Atari 680x0 series. If you know of any additions or corrections please let me know.

ATARI 680x0 TCPIP Software List -- April 16, 1994

Ka9q (old version): Available at numerous sites, although several sites have been reported to have a corrupt version. Good copy located at ftp.tu-clausthal.de under pub/atari/telecomm/tcpip. Wolfgang Ley moderates this site and has made sample configs available in the same directory.

KA9Q-Nos: SLIP, PPP & NNTP software. Currently supported. Mail reader available. Located at ftp.tu-clausthal.de under pub/atari/telecomm/tcpip/ka9q & ftp.demon.co.uk under pub/atari/ka9q (this site is maintained by the author of the atari version).

MiNT-Net : Port of Berkley Unix Sockets, still in an early stage. Looks promising. Still under development. Requires MiNT to run.\
Available at most Atari FTP sites. atari.archive.umich.edu in atari/Mint/Net

pe1chl: A version of Ka9q, available for both the Atari and MSDOS. Currently supported. Available ftp.tu-clausthal.de under pub/atari/telecomm/tcpip/pe1chl

STICP: Available at many Atari FTP sites. I dont believe that it is supported any more.

TUW-TCP: Standard package designed for Ethernet card, but sources and instructions available for making your own driver. Runs as an .ACC or .PRG. Does not like MultiTOS. Located at ftp.tu-clausthal.de under pub/atari/telecomm/tcpip/tuw-tcp.

I have a volunteer willing to translate the final FAQ to dutch, it would be nice to have volunteers for french and/or german, etc. I am also still looking for suggestion, info, tips tricks etc. If you have any thing you would like to share about these packages or SLIP in general feel free to send it.

Yes, now I remember. This was one of the bugs which were fixed in the newer
release.

> My copy came with MulTOS 1.04/AES 4.00 from Hisoft. Where do you get
> the (free) updates?

Wilfred Kilwinger released it several months ago into the MausNet,
but I think you'll find it on several ftp-sites, too. Maybe it's on
a.a in atari/Falcon.

Bye,
Knarf

Is there anybody out there who has sufficient experience in C-programming
in order to compile the C-program Astrolog 4.10 of Walter "Cruiser" Pullen
for the Atari ST ?

The sources are available via ftp in hilbert.maths.utas.edu.au in the
subdir pub/astrology/Astrolog named ast41src.zip.
I also can send them via email (270 KB, uuencoded even larger)

Astrolog 4.10 is a freeware program which can do basic astrological compu-
tations and which surely would be welcomed by many ST-Users. I also know
of some which are looking for such a kind of program.

Is there anybody who has enoug interest and knowledge of either astrology
and c-programming on the ST in order to do such a work ?

Geneva is around takes up around 192k of memory. Neodesk can be used as an overlay so that when a program is launched, only a 35k kernel remains. BTW-you don't need a desktop with Geneva-the hotkeys and filemenu are so good that I find very little use for a desktop now. I use Geneva and Harlekin, but you could also use Geneva with Maxifile or UIS.

The Link gets power from the SCSI drive, Pin 26 I think, also there
there is a jumper in some drives that could have to be fitted..

From memory this is to do with Termination power, the SCSI drive
can get Termination power from the Drive or via the SCSI Buss...

This is the main trap people have with the LINK..

Registered shareware applications often create a `key' file, storing the licenced user's name, address, and key.

Wouldn't it be clever to put these key files in a standard place, so that there is less chance of the user accidentally passing the key file on when giving a (unregistered) copy to a friend.

Putting the key in the program is clearly out (it means the user has to keep the unregistered archive in order to pass it on).

How about:

$KEYS/<progname>.KEY (if KEYS variable exists)
or /keys/<progname>.KEY
or c:/keys/<progname>.KEY
or a:/keys/<progname>.KEY

Checked in that order. Create directory if possible.

1974. SLM 605 and an IBM system

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-18 00:39:49 UTC
From: aj800@FreeNet.Carleton.CA
Message-ID: <CoFJ6D.3wx@freenet.carleton.ca>
Source record: 33207

This message has been posted elsewhere, but in an effort to reach every possible resource, I'll ask again. Is it possible to use an Atari 605 laser printer with an IBM compatible system?

1975. 1040Ste 14-pin joystick port

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-18 01:49:44 UTC
From: jchappel@charon.engga.uwo.ca
Message-ID: <LX8Xkc1w165w@charon.engga.uwo.ca>
Source record: 33208

I would like to get a listing of the pinout diagram of the Atari 1040STe's 14- (actually 15-) pin ports. I am hoping that this port can be used to interface with the Atari Touch Tablet (which was available for the 8-bit Ataris), which only has a 9-pin connector.

Aparently, (from what I've heard) the tablet needs some sort of Capacitor-discharge system so that the computer can read the correct resistance supplied by the touch tablet. It works off of two potentiometer inputs, to supply a 2-dimensional position sensor.

If anyone can help, please reply here. I hope to perform this interface for an Engineering project which has just been started. Don't worry about being too technical--it's my specialty.

Thanks very much.
Jerry

>
> 1) Is there a demo of the new ORCS up on the net? If not, and if one
> exists, could someone plese u/l it?

No demo is available. I'd guess that they feel that a fully functional version 1.0 should be a good enough "demo".

> 2) Is the commercial version of ORCS really Interface (by Shift, Imported
> into the states by Gribnif)? Interface and ORCS have quite a bit in common...

No, they are different products, by different authors. And although they do have some aspects in common, there is a lot about them that is different.

> 3) Where could one purchase the new version of ORCS?

See below...

> 4) Does the Author (Otto) reside on the internet? I'd love to ask him
> some questions....

No, he doesn't (unfortunately).

Jeff, perhaps you missed the detailed response from Herwig Schelauske regarding the current status of ORCS? The last publicized release on ORCS was in April of '93. Here's the info on the current distributor, from Herwig's post:

RICHTER DISTRIBUTOR
Hagener Str. 65
5820 Gevelsberg
Germany
Tel. 02332 / 2706 (german phone-number/FAX)
FAX / 2703
cost: DM 89,-- (one year ago).

That's about $65 U.S., plus shipping. If you do contact Richter and find out more about ORCS, please post the information here, since I am sure there are others interested as well (myself included). Thanks.

Well, it wasn't really a flame, I was just trying to make a point... there are too many demo groups (notably) and games programmers who have in the past made use of unspecified tricks to get their software working. In some cases these are probably justified, but really silly things (my pet hate is people who used 'RTE' to set SR and PC without thinking about format/offset words, that us 030 people have) just get right up my nose.

Dave

1980. TosWin and Fonts Question ....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-18 08:17:17 UTC
From: plord@novell.co.uk
Message-ID: <CoG4Cw.Grw@novell.co.uk>
Source record: 33213

I've been working on an application which runs in a toswin (actually, a teletext viewer). It uses toswin by simply sending the esc sequences as documented.

To make it look a bit better, I've designed a teletext GDOS font.

However, this font isn't really very good if you use it as a shell (some of the characters arn't the same). So what I would like to do is to change the font within my program and then change back to the original font on exit.

So any suggestions to how I can see what font is currently in use in a toswin and change this under program control?

Many thanks,

Pete

|> If worst comes to worst I'll get Sozobon C and use it's Assembler! I heard
|> of an version of gcc-as that works with Motorola syntax. If you have it,
|> please Email it to me. If you know of a good macro assembler, please tell
|> me where to find it - but no GFA BASIC crap!

I did a lot of asm coding with the Sozobon assembler (jas) and I spent almost
as much time chasing down bugs introduced by the assembler as I did finding
my own mistakes. Basically only a subset of opcode/modes used by the compiler
work correctly.

A while back I translated all my stuff to Devpak 3 in about 2 days and have not
looked back since. Although Devpak is usually thought of as based in an
editor/debugger enviroment, I only use the command line version gen.ttp.
The only feature it lacks is auto calculation of instruction cycles and it's
resaonably fast (I get 250 lines/sec assembling from/to IDE on a falcon).

I've never seen a C interpreter for the Atari platform.

The best PD C compilers are (in order of "bestness", which is IMHO):

GNU C - large, available for almost all platforms, you can
cross-compile on a much faster machine for your Atari, and also
is your only option for C++ on the Atari.

Heat & Serve C - based on Sozobon C 1.3, extensively hacked by Ian
Lepore; has a nasty bug in the supplied libraries
though (which only causes a crash under Gemini or
Mupfel shell)

Sozobon C 2.x - the official Sozobon C; dunno much about this

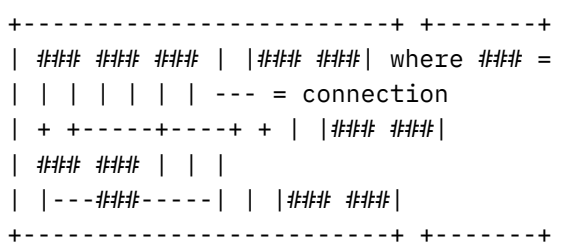
1985. GEM resource files/ gem++

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-18 13:40:23 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1994Apr18.134024.2712@bay.cc.kcl.ac.uk>
Source record: 33215
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm trying to write a cantata lookalike for gem, using gem++ as the
toolkit. I need to have the following arrangement:



The window on the left is a workspace window, the one on the right
is a toolbox window. Each of the icons in the toolbox is generated
by scanning the disk for executable programs -> a list of options.
Each of the icons in the workspace is placed there by dragging an
icon from the toolbox, and then connected to other icons.

The resource file format is a tree for the workspace, a tree for the
toolbox, and a tree for the icons. Thing is, I need to copy icons
from the icons tree to the toolbox and workspace trees. I can't just
hide the icons in the workspace trees, since I might have multiple
instantiations of the icons in the workspace/toolbox. AFAICT objc_add
only deals with adding icons in a given tree, whereas I need to copy
icons from one tree to another, so (at last :-) is there publicly
available source code to dynamically alter the structure of a resource
once it has been loaded into memory, or will I have to make it up
myself ?

It looks pretty complex to do, although I can simplify if I need to
by only adding to the root node of the workspace, and only supporting
ICON types etc. Still, I'd prefer it if it were already done ...

Plase don't do something that is NOT compatible with current HTML pages on
the Internet. If you want to provide a WWW client, the best thing to do is
to provide support for the Sun .au format sound file and inline GIFs. This
is the standard the Internet uses, and providing anything else is a waste of
energies.

>I'm in favour of this because if we've got an HTML widget, we've got

>even if we can't support links to other machines, links within documents
>or to other local documents would be very handy.

If you cannot support links to other machines (and there are some excellent
non-graphic HTML clients, such as Lynx...), you're NOT creating a WWW client,
you're creating a non-compatible "program" which will ensure that ST users
remain in a tiny Internet ghetto by themselves.

What do you mean? What about Hisoft C? That is a C interpreter.

However, if you were only talking about PD C, then I agree with you. But then,
Hisoft C is quite cheap to buy. Just think of it as a shareware program.

I can only second that. HTML is HTML, support what's meant to be supported. As for further Atari formats support, this should be handled like it is handled on all other platforms - by spawning external programs suited for the task. Call up GemView, Paula or whatever when a .IMG and .MOD comes around.

>If you cannot support links to other machines (and there are some excellent
>non-graphic HTML clients, such as Lynx...), you're NOT creating a WWW client,
>you're creating a non-compatible "program" which will ensure that ST users
>remain in a tiny Internet ghetto by themselves.

You're not creating a WWW client, but a pure local HTML reader. As a standalone application that's not a waste of time since HTML is a very good hypertext format, easy to learn and with lots of possibilities (at least in HTML+). The lack of internet support would be missed by those having a SLIP setup or who are a "real" part of the net (ie. ethernet card onto a local network), but it wouldn't be crucial in the first release. You can get a snowball effect here - whenever someone codes a "new" thingie, others follow suit with a better one. Just look at replacement desktops, modular screensavers, bootmanagers, fileselectors etc. As soon as someone proves that there is a market out there, others follow. I'm expecting the same thing to happen with hypertext apps now that ST-Guide is gaining more ground.

Anyway, now that MiNTnet is happening, I can agree with you that an HTML reader without full WWW possibilites seems kind of stupid. Atari's have been sneakernetworked for too long.

This is a repost. Apparently the first posting didn't make it to
the net...
I have a problem with GEMINI 1.99.
I run a MEGA ST upgraded to 4 meg, with Gemini 1.99 as an
autobooting application.
Several programs (make, cc) seem to "forget" the environment
varables when started from the console window. They cant find the
programs they are supposed to kick off (cc in the case of make, and
cc0 in the case of cc).
When i leave gemini and start a shell (msh or gulam) from the atari
desktop all works well.
I have tried to use gemenv.prg, but gemini starts to complain about
illegal env names (ENV$ROOTSIZE and ENV$OPTIONS). other env
variables defined in the root.env file are available in gemini, but
the problem with make and cc still remains.
Can anybody help me?

The only problem with this is that a shareware program has to be good to get
your money. Based on the cover disk version of HiSoft C I couldn't
recommend it. Maybe its just me, but, it didn't like my style of 'C'.

I like the idea, I just didn't like the implementation, Had I been a
beginner with that program then *I* would have been in trouble. Just me,
nobody else, no Sir, no flames. Just me.

If it wasn't connected to a drive, then it won't show up. The Link gets
it's power off the SCSI bus. It sounds like you were just testing it
without the drive. It should work once it's connected to the drive
(and the drive is turned on :).

Hope this helps.

1995. Question: Fread() and Fwrite() buffered?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-18 18:11:33 UTC
From: ant@mks.com
Message-ID: <1994Apr18.181133.11392@mks.com>
Source record: 33228

I'm curious as to whether or not GEMDOS's Fread() and Fwrite() are buffered streams, like Stdio, if they behave similar to Unix I/O read() and write()?

I ask the question because I was wondering if it would be possible to implement something similar to the "Alloc Stream Facility" as described in "IEEE Computer" March 1994.

Would it be possible to describe the "really low-level" file and terminal access performed by GEMDOS and/or the BIOS, in manner that I could substitute customized Fread() and Fwrite() (or point me to the relavent material in the Compendium)?

|> Any comments? Maybe Dave's listening again? (Welcome back BTW,
|> news about Spectre has been missed by a lot of people).

I found this problem when the AdSpeed-ST first came out. There is a small (no pun intended) bug in the routine that determines your memory size, when the cache is enabled. But this problem only arises only on systems that have 1 meg or 2.5 meg of memory.

The solution for the AsSpeed-ST is to setup such that Spectre runs in 8mHz no cache mode. Then, after Spectre is displaying it's setup screen, use the hot key sequence to switch to 16mHz and cache.

You MUST use the version of ICDBOOT that came with the LINK. If you are using it then somebody put the non-ICD Pro version on the Link Distribution disks.

Well mine states 3.32, I think there was a a patch on GEnie but I could be
wrong about this..

I thought the Authors were bring out a complete new version, because they had
left MacDonald Associates....

Does any one know what is going on there, was there ever a New version of
UIS III or was this just talk.....??

I used Sozobon compiler to set up p2c. I use the GNUC-compiled p2c.ttp,
but I recompiled the libp2c.olb using sozobon. Worked perfectly, and
much faster than GCC. p2c generates plain old impossible-to-hand-code
K&R C, so sozobon is sufficient.

To all wannabe Pascal users out there:

I used Sozobon compiler to set up p2c. I used the GNUC-compiled p2c.ttp,
but recompiled the libp2c.olb using sozobon. Worked perfectly*, and
much faster than GCC. p2c generates plain old impossible-to-hand-code
K&R C, so sozobon is sufficient.

Also, I vastly cut down the p2crc file (removed all comments and all
the blank variables).

This makes a very tidy, quite fast Pascal compiler.

If anyone wants it, I can upload it.

(no, I'm not a Pascal user - this was for my SO's university course, for which
she user my old ST)

Well, you could use a modified version of TOSWIN which allows you to
specify the font, size, and windowposition of new windows via the TOSRUN
pipe. Then, your teletext window would open however you wanted.

I have such a modified version of TOSWIN, but I don't use it at the
moment (I just use MINIWIN).

Anyone wants it, let me know. It's unsupported though.

Chris Latham, the author of UIS, did indeed leave Applications and
Design Software and started up his own company, Power Point Software.
The major product he offered was PowerNet. When he started his
company, he advertised that he was the author of Universal Item
Selector and Universal Network and would no longer be supporting those
products. He also advertised a product called FleXor which said it
was the ultimate replacement file selector. I don't think that FleXor
ever came out and I don't think he markets PowerNet anymore. I think
it may be marketed through Dragonware but I'm not sure.

As for UIS, I don't know if anyone at Applications and Design Software
has picked up support of it.

Ok, so, like Warwick's cajoled me in email into starting work on an HTML
widget for GEM++; voila, instant platform independant hypertext for our
poor little Ataris. After I'm done it, that is. ;-)

I'm not commiting to any particular date; I'm going to start work now
though on the HTML classes.

Just thought I'd let you all know so you can harass me in a few months
if I'm not getting anything useful done!

I need some help with Junior Office a Fax program
that I dnloaded from tu-berlin..

Does it work with NVDI..??

I had problems when using it, it would crash..

I replaced NVDI with AMCGDOS, it did not crash...??

Also will it run from another drive than C:

I could not get it to work on anothe drive came up with a STOP
dialog box, with some thing about module...!!!!

Does it support a Supa modem...

Is it any good...??

Thanks.....

Yesterday evening I found out a similar solution. After the Mac Finder
runs, I can throw the switch and enable the cache. Seems we are hitting
the same bug.

Probably Dave found this one also, and solved it for 3.1

Connecting a SM1xx monitor will only ignore the settings in the NVRAM (not all, but most). You have to reset the NVRAM explicitly by using one of the reset-programs. Best idea is to have a bootdisk for that, which will only reset the NVRAM when you hold down the Shift-key during bootup, so you even don't need to have a SM1xx, you only have to connect the right monitor-pins to GND.

Ciao

You can currently go up to 4Mb of RAM and 36Mhz. How high do you want to go? Do
you want to DIY or buy a prebuilt upgrade?

According to the XBIOS source we have here it definately
waits for a sync after setting the new address, or at least
looks like it does.

2013. I need your support (HENSA/micros moderator)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-19 14:53:21 UTC
From: vctec@westminster.ac.uk
Message-ID: <CoIHBt.7Ju@westminster.ac.uk>
Source record: 33246
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear friends

Just started here at Hensa/micros (micros.hensa.ac.uk) and was lucky enough to
be put in charge of the ☐Atari section, as well as another one.

Problem:

Hensa have a *.msg file with every package, briefly summarising a few things.
One of the fields is machine type. So far this has just been filled in with
Atari ST, but i would like to bring this up to date. To be filled in with things
like St, STe, Falcon, TT. Here we have a Mega ST2, and at home got a STe
(TOS 2.06, not Mega). I can only test these progs on the machines I got. Falcon
I'll be getting at work, but don't know when yet. TT, out of the question.

What I'd like, if anyone would like to help me, is would you be willin to
test this software on your Falcon/TT? Test it to see if it works, and that it
doesn't crash. That's all. You do not need to test the program in any other way.
By that I mean you do not need to test it for it's GUI, etc.

I look forward to hearing from you guys/gals.

Things to look forward to:

I plan to make the Atari section at Hensa work, and one of the best places for
Atari PD.

A new Falcon section is being planned. It should (hopefully) be up and running
in about a months time.

All facon only software will go in this directory. Soft that works on both will go in the
TOS directory, and MiNT stuff in the MiNT directory. I plan to support
Mag!X and geneva, and OMEn too, if they are good enough to have PD patches etc.

Oh, and the mainframe is changing. The new one...HENSA/micros II (A Sun Sparc)
compared to the first one now (a Sequent Symmetry), will be a lot faster, more
memory, disk space, and support more users on-line.

At the mo, the Atari section doesn't have many people logging in. But I hope,
that from next week onwards....when the new machine is on-line, it will be
bustling. The new machine now supports, ftp, x,y,z modem, gopher, and
World Wide Web.

So come on you guys.....I need your support for the Atari section. Let people
know that Atari is not dead in this country. Log in to hensa

help needed with the following files for Falcon/TT compat:

STZIP2.5/2.4
BoozGEM 2.1.3
LHarc 3.0
Chameleon 1.19
ESS-Code 5.06
Pack_ice 2.40

These files, I installed on the new machine, over the past couple of days. OK,
so half of them are old files, but I felt that I needed to put them on the system.

Does anybody knows if it's possible to connect (or fix) an PC DS/DD to use in a old 520 ST (tos 1.0), cause I have an old external SF 354 SS/DD; and I've tried to use an PC High Dens. DDrive, (but I think that works like DS/DD); and it doesn't works ... :(

Help me please ...

Edwin Beard

PS : ... " since 1988 (+-) there are no places where to buy or get hardware for the ST." :(

my E-Mail : ebeard@cec.uchile.cl

>>>start with inline .IMG support and Atari sample support, and add more
>>>standard things (ex, inline .GIF/JPEG, .AU samples) later.

>As for further Atari formats support, this should be handled like it is
>handled on all other platforms - by spawning external programs suited for
>the task. Call up GemView, Paula or whatever when a .IMG and .MOD comes

I don't completely agree, if this is to become a standard format for
the atari hypertexts too, and not just something to view 'that net
stuff'. Keep in mind that *atarists* would also like to create their
own documents and on ST it's a *lot* easier to make some IMGs than
gifs.

B&w IMG format is also so simple (It can be packed quite fast even
with basic ;) that depacking it won't take much coding. It could also
be easier (from the programmers view) to test inline picture funtions
with IMGs than gifs. On the other hand, (IMO) all sound formats can be
done with external programs as they normally aren't nearly as
important for the document as pictures (I can send some ST-rez
compatible examples for the interested parties).

>>If you cannot support links to other machines (and there are some excellent
>>non-graphic HTML clients, such as Lynx...), you're NOT creating a WWW client,

Well, those that need linked hmtl use lynx then ;-). Has it been
ported yet?

I just downloaded a version of the ICD utilities a couple weeks ago
and when I tried using them, they informed me that I wasn't using an
ICD host. I've had other replies tell me that I need the Pro version.

I've also heard about the parity thing before. I will disable that
before using the drive. I also have access to a utility that will
turn on the 64K write cache on the drive.

Thanks for the input!

Michael

2019. need help w/ Cumana OSK v2.3 for Atari-ST plz?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-20 01:48:04 UTC
From: paulseniura@delphi.com
Message-ID: <BQxNrgs.paulseniura@delphi.com>
Source record: 33252

Sorry to bother y'all again. I'm still trying to get my OSK v2.3 from Cumana (Atari-ST) talking to my SCSI drives. They're connected to ICD's host adaptor as SCSI IDs #0 & #2. They work 100% just fine with Atari TOS/GEM and ICD's drivers (v6.2.3 currently). But OSK gives me "Not Ready" errors on some files esp. big/large ones. And OSK doesn't like to do a "physical" format. But the STHD driver from Cumana (Reccoware) *can* see the drives and report their correct SCSI info (via FORMAT and FREE) -- honest.

When I posted this plea for help a couple of months ago, one person in Germany suggested I patch STFD (not STHD?) at offset $8E0 to make it $20 or more. Without any further details than that, I didn't do this (for obvious reasons!). So here's the IDENTs on these two modules as delivered by Cumana:

```
Header for: stfd
Module size: $CC6 #3270
Owner: 0.1
Module CRC: $A3FDB2 Good CRC
Header parity: $1E39 Good parity
Edition: $15 #21
Ty/La At/Rev $E01 $A001
Permission: $555 -----e-r-e-r-e-r
Dev Drv, 68000 obj, Sharable, System State Process
```

```
Header for: sthd
Module size: $A9C #2716
Owner: 0.1
Module CRC: $C45E91 Good CRC
Header parity: $1E46 Good parity
Edition: $1F #31
Ty/La At/Rev $E01 $A000
Permission: $555 -----e-r-e-r-e-r
Dev Drv, 68000 obj, Sharable, System State Process
```

Another person (from France) thought I should get ICD's latest adaptor. I don't see why because the one I have can honor the SCSI commands just fine. And/or I should get OSK v2.4 -- talk about money I don't have!

Then Cumana told me they'll do some more testing -- I haven't heard back from them at all for 2 months almost. (I've stopped calling/faxing them since my phone bill grew to over $140 one month -- effectively doubling the price of this package!)

I don't see why I'm having so much trouble getting help! The two drives are a Seagate ST277N and a CDC 96-meg, and both are very reliable and quite fast for my purposes (never big enough, though, ya know). ICD's partitioning software can even make the part'n info AHDI-compatible. And.. it all *almost* works with OSK.

-*-

I'm also still inquiring on how to buy G- or K-Windows for this Cumana flavor of OSK. V2.3's "console" driver does support a Get/SetStat call to deliver the address of the screen memory, so I'd think we'd be able to run a window/gfx package. (Sadly that's all I know about the technical details -- Cumana only sent me Microware's v2.1 tech docs, not v2.3 or any Atari-specific tech docs.)

I'm about to give up, folks. I'm already hugely miffed how the CoCo/L2 support has withered. Those of you who know me, I want to write some MIDI packages (and you know why :) but I need gfx & windows! If there's no GW/KW for Cumana, just say so! I'll ask Cumana to give me my money back and you'll never hear from me again! This is getting way too expensive for a home hobbyist!

-*-

Thanks for putting up with me again. Please send me e-mail if you've got any clues I could try. I'll certainly appreciate it.

. -- thx, Paul Seniura (from Oklahoma City)

In article <2osici$cv7@uqcspe.cs.uq.oz.au> warwick@cs.uq.oz.au (Warwick Allison) writes:

>Registered shareware applications often create a `key' file, storing the
>licenced user's name, address, and key.

>Wouldn't it be clever to put these key files in a standard place, so that
>there is less chance of the user accidentally passing the key file on when
>giving a (unregistered) copy to a friend.

>How about:

> $KEYS/<progname>.KEY (if KEYS variable exists)
>or /keys/<progname>.KEY
>or c:/keys/<progname>.KEY
>or a:/keys/<progname>.KEY

>Checked in that order. Create directory if possible.

Sounds *very* sensible to me. Now, what about *.inf files? Most programs use
those as well and either put them in the working directory or in the root
directory of C:. I'm tired of a cluttered root directory - a few files are
OK, but 50+ files are too much. What about a $PREFS variable, for those *.
inf and similar files?

A further comment on the 'create directory' part: C:\KEYS as default + the
addition of 'setenv KEYS=c:\keys' in GEM.CNF if possible?

2023. MARKET SURVEY

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-20 03:50:14 UTC
From: sngmedia@world.std.com
Message-ID: <CoJHBs.C5n@world.std.com>
Source record: 33257

We are a small, dedicated group of people desperately trying to get a video production company off the ground.

Recently, we secured enough financial backing to produce several videos on the subject of personal computing.

Because we don't have the financial resources to perform a traditional market analysis, we considered several alternatives and concluded that we should consult the people of the Internet, who are technically proficient and tend to be enthusiastic personal computer users.

We would like you to indicate which three of the below described videos would appeal to you most.

Please note that each video synopsis is numbered. When you are ready to send your response, please specify the numbers corresponding to your three video selections, and use commas to separate the numbers.

For example, if you choose selections four, eight, and eleven, the body of your letter would simply be:

4,8,11

and nothing more.

When you send back your response, please specify "MARKET SURVEY" in the subject field. Then, direct your response back to sngmedia@world.std.com.

Please realize that this is not an advertisement, or solicitation. We simply would like to know your response. You will not be contacted further.

Thank you in advance for your help and cooperation.

Tom and Randi Fecker
sngmedia@world.std.com.

Please select three videos that interest you most:

1. The Internet Pilot's Guide
A plain English guide to getting around on the Internet by veteran users. How to use Internet resources to send/receive e-mail, and to search for documents and files relating to a particular subject. How to use LISTSERVs, GOPHER, ARCHIE, WWW and WAIS. How to use FTP and Telnet to access remote computers for file transfers, remote

logins, etc. Also, learning how to observe Internet's "netiquette." And how to access multimedia Mosaic bulletin boards.

2. How to Make Money at Home With Your PC I -- Successful PC-Based Businesses
Meet five successful entrepreneurs who started their own home-based businesses using a PC. Includes businesses that provide typing services, mailing list management, horoscopes, bookkeeping, and even a software developer who does not know how to program -- he hires other people to implement his software designs. Includes ideas for two dozen home-based businesses you can start using your PC.

3. How to Make Money at Home With Your PC II: Portfolio Management.
Whether you manage your own portfolio for investment gains, or you take on clients for a consulting fee, a PC can give you powerful tools for portfolio management. Meet three successful home-based portfolio managers who use their PCs to maximize profits. They'll inspire you, and share some tricks of the trade that can help you land clients and get started. We'll also show you how to determine which software applications will meet your needs, and which online services will satisfy your requirements.

4. How to Make Money at Home With Your PC III: Telecommuting
Learn how to use your PC to telecommute to companies across America that are looking for specialized consultants with skills like bookkeeping, software design and programming, editorial and script writing, technical proofreading, graphic design, copywriting, and more. Includes interviews with three successful telecommuters who use their PCs, faxes, modems and phones to serve distant clients, and information about a telecommuting referral service that could help you find employers.

5. How to Upgrade Your Hard Drive, Step-By-Step
From choosing your new hard drive, through ordering, installing and testing it. This plain English video shows you how to do the job correctly, one simple step at a time. Using industry-wide standards, we'll show you what all hard drives have in common. Includes how to determine if your controller will support a particular hard drive. How to remove the old drive, and install, format and test the new drive. Includes a discussion on the differences between the various standards.

6. How to Design Your Own PC
You don't have to be an engineer to design and build the PC of your dreams. This plain English video shows you how to figure out the PC design that is best for you, how to specify components, how to make sure they'll work together, and where to buy them. You'll end up with a top quality system that will save you money.

7. How to Build Your Own PC
Once you've designed your PC, we'll show you how to build it. The

actual process will take you only a few hours. Using an easy-to-understand method, we'll show you how to inspect, install and test components. Includes tips and tricks from computer production experts. The technical skills can be easily mastered by almost anyone, and you probably already own most of the tools you would need.

8. How to Increase Your Computer's Memory
This plain English video shows you how to determine whether your computer memory can be increased, and how to do the job correctly, one step at a time. You'll learn about industry-wide standards for memory, how to configure additional RAM and cache, how and where to buy RAM chips, and three ways to eliminate low-quality RAM chips. Covers all phases of the process from opening your computer, to testing your memory. Includes discussions on how to ensure your DOS set-up is able to access all available memory, and how to use various memory management software applications.

9. How to Use MS-Windows 3.1
This powerful graphical user interface can help you work smarter and faster, but the manual and the online tutorial that come with Windows leave many questions unanswered. This plain English, step-by-step video will show you how to install Windows on your computer and set it up to get optimum performance.

10. How to Find a Job in the Information Age
A PC can give you an incredible advantage when you're searching for a new job -- or even a new career. But you have to know just how it can help you. In this video, an experienced employment counselor will show you how to tap the power in your PC to find job leads, create a winning resume and customized cover letters, tap into databases and find bulletin boards that will lead you to job openings, and use online services to research potential employers.

11. How to Install a Sound Card in Your Computer
Here's how to add incredible stereo sound to your computer with step-by-step help. In plain English, you'll learn how to determine if your computer can support a sound card, how and where to buy a high-quality sound card. How to open your computer, and install and test the sound card.

12. How to Install a CD-ROM Drive in Your Computer
Using simple tools, this plain English video shows you how to install a CD-ROM Drive in your computer. You'll learn how to make sure your computer can support a CD-ROM drive -- and what to do if it can't. Covers internal vs. external drives, how and where to buy a high quality CD-ROM drive, what you need to know about differing industry standards, preparing the drive bay, testing and trouble-shooting. Covers SCSI and IDE.

13. How to Fix the Most Common Computer Problems
Your computer serviceman may not want you to know this, but all you need is the know-how you'll get from this video, simple tools, and

easily-obtainable diagnostic software -- and you can fix most common problems you'll ever encounter with a PC.

14. What to Do When a Virus Strikes Your Computer
Viruses can come from almost anywhere: a colleague or friend's disks, a network, a bulletin board, even commercial software. If you ignore the first warning signs, a virus can wipe out your data and permanently damage your computer's memory. In plain English, this video will tell you how to scan disks for viruses, how to check downloaded files from bulletin boards, how to set up a virus prevention program for your home or office computer, and how and where to buy the best anti-virus software. We'll also cover the pros and cons of the antivirus software in DOS 6.X and Windows 3.X, how to use antivirus software, and more.

15. How Your PC Works: Inside the Case
Here's a down-to-earth explanation of how your PC actually processes information, and what really goes on inside the case. You'll get a guided tour of the insides of a PC, learn about how the various components work and how they communicate with each other, and get a clear explanation of technical terms. A must for anyone who wants to really understand how to program, use and repair a PC.

16. How to Create Config.Sys, Autoexec.Bat and Batch Files
These basic files can make it much easier to use your computer -- or cause incredible headaches if they are not written properly for your particular software and peripherals. Now you don't have to be at the mercy of murky tech manuals, because we'll show you how to create files that work for your system -- step-by-step, in plain English. You'll learn how to write, modify and test Autoexec.Bat and Config.Sys files; and how to create batch files.

17. How to Add a Modem or Faxmodem to Your Computer
Here's the easy way to add a modem or faxmodem to your computer, with step-by-step guidance from this plain English video. You'll learn how to determine if your computer can support a modem or faxmodem, and what to do if it can't, how to choose and buy the best modem or faxmodem, how to open your computer, and install the modem or faxmodem, how to test it, how to quickly eliminate common problems, and how to set your modem or faxmodem correctly.

18. How to Make Money at Home With Your Computer
The information age is opening up incredible new opportunities for PC owners to make undreamed of money, using skills and knowledge you may already have! Here's inside information on the ten most promising telecommuting jobs and 12 small businesses you can run right from your home, using your PC. Includes profiles of PC owners who are actually running PC-based home businesses.

19. The Super-Highway Roadmap
This is your guide to where to go and what to see. You can make

incredible contacts and gather powerful, valuable information on the Internet, but the problem is that most people can't begin to imagine the potential of something that seems so abstract. This plain English video will introduce you to the Internet, and make these opportunities concrete. Includes interviews with 7 people who did the impossible by gathering information and making contacts on the Internet.

20. How to Upgrade and Repair Your PC I: Basic
This is the video your repairman doesn't want you to know about! Since the components of most PCs are highly modular, PC repair is easier than you think. Just pinpoint the problem component, unplug it, remove a few screws, replace it, and presto! You're in business again. This step-by-step video shows you how to pinpoint problems and replace your PC's components, using ordinary household tools.

21. How to Upgrade and Repair Your PC II: Multimedia
Here's how to save big money on a PC with all the latest multimedia peripherals. You learn how to determine if your PC can be upgraded, how to upgrade your video card and bus, and how to add a CD-ROM drive, sound card, video accelerator, and more. Presented in plain English. The procedures you'll learn require ordinary household tools -- nothing fancy!

22. Plain English Guide to DOS 6+.
The powerful sub-programs buried deep within DOS 6.0 and higher can help you work smarter and faster, but the manual and the online tutorial that come with DOS leave many questions unanswered. This plain English, step-by-step video will show you how to install DOS on your computer and set it up to get optimum performance. In addition to DOS commands, you'll learn how to use the shell, defragmentation, scan and antivirus programs that come with DOS.

23. Home Financial Management on a PC.
Your computer can help you create and manage a budget, keep track of your credit card accounts, handle your tax deductions, and reconcile your bank accounts. But that's not all! You can also determine whether you should pay down your mortgage, finance a new car or pay cash, buy or rent your home, and how much you'll need for retirement. The financial information your computer can give you might mean the difference between just getting by and a very comfortable lifestyle -- if you ask the right questions and use your PC to develop a financial strategy.

24. The Online Bulletin Board Guide
Bulletin boards can be the on-ramps to the Information Super Highway -- if you know how to access and use them. This step-by-step guide shows you how to find bulletin boards, set-up your modem, log on, find out what they have to offer, find bulletin board users who share your interests, search for information, and upload and download files.

Thank you.

This is perfectly acceptable. For example, XMosaic, the X11 WWW browser
understands X11 bitmaps as inline images.

The SLM605 has an ACSI interface which no clone knows about. Not even
the Falcon has an ACSI interface, but there is a third-party SW/HW
solution which can be used to drive a SLM605 from a Falcon. The same
should be possible for a PC, but I don't know of available solutions
for this application.

IMnot-soHO Gemini is absolutely the best desktop replacement for the ST.
Beats Neodesk in almost all respects (I _do_ like Neodesk window-features
(splitting, doubling)). Esp. the shell (Mupfel) is the best invention
since the computer :-).

>Gemini 1.21 has been available with english texts and english manuals.
>Unfortunately, the feedback wasn't worth the trouble to do all this again
>with the current version.

I personally don't care for docs, since Gemini is very straightforward IMO.
The only stuff that's not completely clear is the shell-script syntax. A
list of script-commands would have been *very* nice...
You don't happen to have such a list handy, do you? :-)

Source record: 33030

Hi, I've got a Falcon 4/170 and I've just bought the Atari Compendium.
I also have Motorola's DSP manual and I'm embarking on that long road
to programming the ultimate Falcon Game for shareware release.
Obviously I'd like it to go commercial but it is my first game!

I need any help but I'm particularly interested in any code (in C or
readable assembler.) for mapping bitmaps into 3D space (i.e. Doom
type stuff). DSP or 68030 assembler is okay.

Any help with PD disassemblers/assemblers/debuggers would also be
very nice as I currently can only list dissassembled code and
these can take a long time to read through.

2029. Storing Window locations on disk in Geiss' Package?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-20 14:43:43 UTC
From: bert@brazil.WPI.EDU
Message-ID: <BERT.94Apr20104344@brazil.WPI.EDU>
Source record: 33261

Hi,

I am using the Geiss' GEM package, and I would like to store the locations of the open windows in <modulename>.INF files, when the program gets exited. Then, when the program gets started again, it should automatically open the windows at the same locations in the same size.

I tried different ways of doing it. What I am currently doing is that the WINDOWS.C module saves the windows information (window->work and window->opened) in the <modulename>.INF file. Then when I start the program, a routine checks if there are any .INF entries for each module, puts the workspace coordinates into a newly created window structure and then openes the window using the open_<modulename>(icon) function for that module, if window->opened in the file was set to a value larger than one.

The problem is, that the snap_window function does not seem to like that method. It makes the windows smaller than they should be, i.e. I think it makes the window _with_ name-bar, info-bar and menu-bar the same size that the work area (whithout all that) was. Maybe I need another kind of window->snap function?

Can anyone help?

Thanks,

Bert :)

:> >Does anyone 'here' know how this works?

Have you ever heard of "volume-only mode"? The old Commodore computers had this
too. When all channels are switched off, the volume register controls
the speaker membran directly. So it works an an D/A.

:> drive in the drive table?
:> Thanks for any replies, this will save me quite a bit of money if I
:> were to purchase the drive and find it doesn't work!

There is some trouble with the new Maxtor drives and Mega STE controllers.
Even earlier Maxtor drives didn't work with all ST's but Mega ST/E's.

But the new 7xxx series have even trouble with Mega STEs.

In most cases, you must remove the terminators from the disk.

AHDI will work OK, also does Hushi/SCSITOOL.

Source record: 33264
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just got my TT upgrade to TOS 3.06 and had an AJAX and HD drive installed
It works fine except with SPectre 3.0 - it won't read or write or format
mac disks - everything gives an initialization error (all disk are Low Density).
It this normal? I assume 3.1 will allow R/W/Fmt of all mac high and low density
formats? I know that the AJAX chip didn't exist when 3.0 was released so
this may be the problem?

Thanks for any help,
Sam

And I would like to announce that Lynx, the curses based WWW browser is working right now on my atari. Right now I only have a 68020 only binary, I'll make a 68000 binary when I have experimented some more (I want to add term support).

The ingredients for those who would like to compile it themselves:

- gcc (I use a cross-gcc)
- MiNTLibs (mine are at pl44)
- MiNT-Net (version 0.30)
- ncurses (might not be strictly needed, but is if you not only want inverse-video but also bold and underline). This one needs to "ported" to the ST. I'll make patches relative to ncurses 1.8.5 available. Note that ncurses doesn't use the termcap database, it uses terminfo. I'll have to see if I can dig up an st52 terminfo entry.
- the Lynx source code (mine is beta version 2.3)
- (when term support works:) term for the atari (I use Kay Roemer's term 1.0.8)

As you can see, this is not for the faint of heart... :-)

I'll put the binary and my diffs for everything up for ftp on ftp://ftp.twi.tudelft.nl/pub/atari/
You can mail me if you have problems getting everything installed properly.

I do hope the people who want to do a GEM WWW browser take a look at this, it could save them a lot of work...

Bart.

Message-ID: <1994Apr21.062213.22270@ucl.ac.uk>
Source record: 33268

This is probably now an FAQ... It is some years since I used Atari machines and a colleague of mine has just asked me about upgrading a Mega ST1 bought in 1991 to 4Megs or more. I remember that in the old ST2 machine I originally had it was a simple matter of adding the extra memory into the empty space in the PCB to give me 4 Megs. Was this the case for the ST1s ? if not what is involved ? or is it really better to let a company do it ?

Please email any responses to me because I don't usually read this list.

Thanks in advance

Tim Whitlock

2037. FSP (WAS: Mosaic/WWW ??)

Hello "MiNT-netters"

Obviously, there has been some porting of Net-Software, now as MiNT-Net
becomes more and more popular.
For those, who are interested, i've compiled the fspclient source with no bigger
problems.
FSP is an "UDP-based FTP", and is a lot like his TCP-based brother.
There are a couple of sites, which support FSP (i.e. ftp.germany.eu.net,
src.doc.ic.ac.uk, tu-clausthal, wuarchive and a lot more). I already
transferred a lot of files via SLIP using this tool and it worked fine.
Because i think that FSP is a better solutiuon than TFTP for now, i will
upload the stuff tonight. Probably to ftp.germany.eu.net and/or
src.doc.ic.ac.uk (using FSP of course :-)).
Perhaps there is somenoe, who can send it to a.a.u.e !?

I'm also working on a fspd. As soon as i have a stable (rigth word ?) version,
i'll let you know and send it to the Net.

cheerio Theo

2040. SM124 Monitor Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-21 13:10:17 UTC
From: cb170@city.ac.uk
Message-ID: <cb170.766933817@Penryn>
Source record: 33272

Can anyone help me with a problem with my SM124?

Normally the monitor works fine, but if there is only a little bit of white on the screen (ie predominantly black), what white is there fades.

So, if I have a white letter G in the middle of a black screen, the G fades after about a second until it virtually dissapears.

Is this an easy to fix/common problem?

Does anyone have info an the layout for SIMMs? 1M and 256K, 8 and 9 bits, 3,8, and 9 chip versions. Pin-outs would also help.

Also looking for info on the interface betweem CPU and SIMM, specfically for 1040STe. How is the memory actually mapped, how is the size determined, why STe can't have 2.5M, and why the 4m limit since the 68000 can access 16M directly? What is the slowest SIMM a STe can use without slowing down the processor.

ANY info is helpful, schematics, timing diagrams, or where to find this info is what i really need.

thanks in advance,

Thomas

|>

While we're at it.
How difficult do you think it would be for you to write a wrapper that translates
X windows primitives to Gem AES/VDI primitives (with the help of your C++ library).
Maybe an X-server on top of Gem is the way to go instead, similar in principle to
the X-servers running on top of OS/2 and Windows. This way mosaic (and LOTS of
other applications) would suddenly be available for us...

I'm currently working on the X-libraries+apps - which seems to be very straight-
forward with the help from the mintnet socket library. Only a few files won't compile,
because the lack of TCP support in the current version of mintnet. If only I had those
tcp header files...

In fact - the biggest trouble was to get a stable imake running, which included
hunting down a cpp that didn't add all sorts of extras to its output. (For the
curious mind - I ended up with a recompiled cpp from good ol' gcc-1.33, this worked.)

Now I have compiled 95% or so of all the files in the various libraries, some
libraries are complete. I thought about making a black/white X-server based on
the sun-one. My hope is that I can use the same hacks as used in the mgr window-
manager to get this one up.
However, it would be VERY MUCH NICER to have an X-server just running on top of
gem, so that eg. cut/paste between gem/X windows is possible...
This would also slow things down quite a bit I presume, so a standalone b/wh version
not using AES will also have a right to live.

Well, something to think about ?

BTW, this is X11R5.

Erling
(And yes, Tomorrow Friday I promise I will send you the scsi debug version of
you-know-what)

Me too! Especially: Pin outs (are these standard anyway between 3 chip & 8/9
chip simms?) Timing (do you have to make sure you test for timing and don't
run them to fast, or is there a decent data transfer protocol where they let
you know when the data you requested is ready?) Refresh (they're DRAM so I
assume you have to do it, but HOW? Never got this.)

As far as memory sizing goes, this is how the STe memory size routine works:
(TOS 1.62)
Set memory controller nibble to 2Mb/2Mb bank sizes
Write some data from $08 to $108 ish (random choice by
atari programmers)
and $200008 to $200108 ish (the
start of each bank)
Make sure the data is still there (if so, something is in
that bank)
Test to see if same data appears at $[0/2]80008 = 512K bank
" " " $[1/3]00008 = 1M bank
Otherwise 2Mb bank.
From this knowledge (how much memory installed in each of
banks 1 & 2) calculate proper controller nibble
(All the controller does is make sure bank 2 appears at
the 'right' address)

Calculate phystop from this.

This is where they got it wrong:

Throw this value of phystop away.
Recalculate it incorrectly and write the system vector
accordingly.

The problem is TOS ends up thinking you have 4Mb if you try putting 2.5Mb in.
To get 2.5Mb in a STe therefore, on a HARD boot, you need to put $280000
into _phystop and call the reboot vector ($e00030 on my TOS - stored at
address $4) ('cos the OS takes _phystop, uses it, twists it, and generally
copies it around the place at soft boot time, but only recalculates _phytop
itself after a hard boot)

There are certain caveats if you're using other programs/accessories which
mess around with _phystop at boot time.

I have a smart AUTO folder prog to do this which I'll upload tomorrow or
saturday.

Btw: (undocumented stuff I think) On soft boot TOS 1.62 checks $5AA and if
it is/isn't set will call the hard boot routine anyway. (If this is
at all relavent to you you can check the exact details on your
machine - its right at the start of the ROM in with the other
reset vector/memory vector checks.

See ya.
John

Hiya!

Sorry, I've never heard of .699 format modules. What produces them... An Amiga MOD editor or what? I'd be very interested in having the format of the files if anyone has them...

Best place to ask for such things is alt.binaries.sounds.mods... You never know!

Seeya,

David

I'm sorry to tell you, but it is *not possible* to use the x1 mode when
operating in async mode with the internal baudrate generator.
Use of x1 mode requires an external clock which is synchronous with the
data. In async mode you must use x16 mode.

It's an IBM mod format I think. If I can get hold a actual .699 file, I know someone who has experience of just about all mod formats who'd love to have a bash at decoding them.

> According to the XBIOS source we have here it definately
> waits for a sync after setting the new address, or at least
> looks like it does.

I replied to Chris asking him what source he was using. It was from
Internals so I checked my copy. It turns out we are both right and
wrong! These are the first few lines of disassembly from Internals:

```
tst.l 4(A7) ; New logical screen test
bmi 57AC
move.l 4(A7), $44E(A5)
57AC:
tst.l 8(A7) ; New physical screen test
bmi 57C2
move.b 9(A7), $FFFF8201
move.b 10(A7), $FFFF8203
57C2:
tst.l 12(A7) ; New resolution test
bmi 57EC
move.b 13(A7), $FFFF8260
bsr 5544 ; Wait for vertical blank
.
.
.
57EC:
rts
```

So it does wait for a vertical blank but only if the new rez is not
-1! Any intersted hackers can disassemble this routine in different
versions of TOS to see if this bug was ever fixed.

2056. Need Help Porting From X-Windows to Atari gcc

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-22 01:37:41 UTC
From: scotty@verdix.com
Message-ID: <scotty.766978661@sarge>
Source record: 33286

Hi.

I'm attempting to port a program that compiles and runs fine under X Windows on Sun 4 to the Falcon, using GCC. The code that's breaking has been compiled and run under GCC on the Sun without problems. I'm hoping that someone who's done similar work will recognize the sort of problem I'm having and point me in the right direction.

The program converts various image types to X Windows images and displays them. I have it working to the point where it will read in a GIF format file, and begin to parse the image data from the *.gif file. What happens is, regardless of the image file, it gets an "end of data" marker from the file before the image is completely loaded, and the program exits.

I've tried using it to read several different GIF images, and in each file it exits at a different early point. I've been trying to use GDB to catch the fault, but it runs so slowly when checking a conditional breakpoint on my machine, that I can barely try it twice in an evening!

The GIF images I'm parsing are known to be good, and display just fine with True Paint. I'd like to let this program build the X-Window's image, and then do a last-minute conversion to display it in the Falcon's 256 color mode. I've even compared the variable sizes and the sizes for char, short, int, and long (1, 2, 4, and 4 bytes, respectively), and they match on both systems. I just can't figure out what would make data read from a file with the same function calls (fopen, fread) appear different!

Thanks for any ideas, debugging suggestions, or encouragement...

Scott

Atari, in it's wisdom, decided not to wire the highest two address lines on the PCB. It's a variant of the classic Bill Gates' adagium: "640 kb should be enough for any application", and IMHO just plain stupid. There are schemes that allow more memory, but they involve heavy soldering, and probably even PCB modification.

Your work sounds great! But what headerfiles do you mean, the tcp_* ones
in /usr/include/netinet/ ?

If you just want to see if they compile, I will include them in the next
MintNet release. The bigger problem is the TCP code in the device driver :)
I'm working on it, and I suppose there will be a first version of MintNet
including a working TCP available for testing in a few weeks.

A few weeks ago I have made an intermediate version 0.31 including IP
fragmentation and some bug fixes. I'm not going to release this version
to the public, because it contains unfinished code. However, if you are
are having trouble with 0.30 / want to help me test the thing / just keen
on getting a new version, please mail me.

Are you using *binary* mode with fopen on the Atari? This is not
needed under Unix, but on the Atari the libraries do LF/CRLF
conversions by default.

.669 are some IBM format file. After doing an archie search, all I
found was a MOD-to-669 converter program for IBM clones (the docs
mention the Soundblaster, I think, but doesn't give any specs on the
file format). I've asked TWICE now in the alt.binaries.sounds
newsgroups, but nobody has any answers (I just get Email replies
from people saying they'd ALSO like to know about them). From
looking at .669 files through a sector editor, they seem quite
similar, header-wise, to MOD files.

2062. VDI and AES handles

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-22 10:10:54 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Apr22.101054.19533@beaver.cs.washington.edu>
Source record: 33143

Is there any way to get the AES handle of another running program when all you know is its VDI handle? How about getting the VDI handle by just knowing its AES handle?

For example, if I wanted to send a message to a program to re-draw its windows, and didn't want to send it to all the running programs, I could search for its AES handle by knowing the file name (e.g. NEODESK).
Don't ask why, but I also need to know the handle of its VDI screen workstation.
To repeat:
So is there any way to get the VDI handle, knowing the AES handle?
Or, if I just know the VDI handle, how can I get the AES handle?

Thanks!

As far as I know, .669 mods are created by a program on IBM-PC called 669.
They are eight voice mods.

Don't know where to get complete .669 specs, though.

bye,

>

Sure it's possible. If you wanted (I tried this once), you could
just leave the keyboard shortcut 'text' (ie "^C") at the end of each
menu string, and then when you get a keypress in your app, convert it
to a string of the same format, and then search your menu tree. Works
fine. You could also save your menu settings etc in your .RSC file (I
tried this once too, but in another app :-), by reading the .RSC file
in manually, stepping through the structures, copying the 'live'
ob_state words across, then re-saving the .RSC file I loaded in by
hand.

You have to watch two things:
1) You locate the RSC file correctly -- use shel_find(), that uses the
same algorithm that rsrc_load() uses.
2) The RSC file format changed subtly in recent AES versions, to allow
G_CICONs to be stored, and to break the 64K barrier.

D'n'D is only documented in the Compendium, but the Atari clipboard protocol is described in the documentation that comes with one of the clipboard CPX modules (the SDS one). Xacc is not an Atari protocol, but Gemview actually comes with Xacc documentation.

The Style Guide is included in the Compendium and also the Modern Atari System Software book from Hisoft. I believe one of the Atari DocSupport packages also covers the style guide.

(The Compendium is about 40 pounds, and is available from Hisoft in the UK)

2072. Broken Transfer rate from ICD host

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-22 17:19:12 UTC
From: Joerg_Spilker@daolin.fido.de
Message-ID: <2db81657%fido.de@p42.f205.n6000.z242.fidonet.org>
Source record: 32998

Hi all,

i had some very strange problem. I'm running and ICD hostadapter with 3 drives connected (Fujitsi 2694SA (1GB) and 2x Quantum PDS 210). The normal transfer rate was about 1,1 MB/s for all drives.

Since two weeks i only get about 50K/s to 180K/s.

My question: Is my ICD broken or is there any hardware problem on my ST.

Greetings, Joerg

2073. Atari Style Guide/drag and drop docs?

```
-> Could someone out there mail me some info (or tell me where to
-> find some on a.a.) about the drag and drop protocol and the
-> Atari Style Guide?

If you're just looking for an explaination, then basically the
drag-and-drop protocol works like this:

The user grabs a file from a window or the desktop and then drags it on
top of another application. The filename is passed on to the ARGV
command line (path and all) (located at BASEPAGE+128). If the
application is designed to look on the basepage for a filename, it will
pick up the filename from the command line and then load (or do whatever
actions are appropriate to) the filename found there.

There is a file on atari.archive.umich.edu called ibmfloppy.lzh (or something
similar) that has a bunch of information about connecting floppies to the
ST. Hope that helps.

It appears to be common. Two of my three SM124's do it as well. I think
it might be a sign of age, but I could be wrong (the newest one I have does
not do it, yet).

Hiya!

Coo, Is that how it works? I've been using ST replay routines for a while
but never realised that. The peculiar table of numbers is so that you add
3 channels worth of offset to get a decent resolution then?

hi guys, first of all, this is in the USA!!! :)

I'm looking for two storage cards for an Atari Portfolio,
and I mean AS SOON AS POSSIBLE!!!

I tried looking into every bookstore I could looking for
Atari magazines (in Boston) but with no success (so that
I could look up vendor addresses/phone #'s).

So I need either:

- for you to sell me 1 or 2 storage cards
- to tell me where in New York or boston
i could find atari equipment
- or some phone numbers of companies that
could provide me with these cards.

Thanks for your time atarians!!!

...
> * email: boyd@math.fsu.edu Office: (904) 644-7167 Pager: (904) 657-6425 *

This is a common problem. When the screen is nearly dark, not enough current
is drawn to allow one of the voltage regulators to do its job, and the
power supply voltage drifts up a bit, changing biases and cutting down the
current even further. End of picture ! The solution is quite simple, just
add a bleeder resistor to ground, to draw a bit more current, and all's well.
I'll continue to dig down thru my archives, to see which supply that was.
The name B2 comes to mind, but that could be wrong. It's just a hundred volts
or so, so is relatively safe to mess with. As I recall, another recommended
fix was to add a Zener diode to the circuit; but the resistor is sufficient.

I know all this stuff! You didn't READ my message! I said I want to send a
redraw message only to ONE application, not everyone!
I can send a message to it to redraw via appl_write(), but I need to know its
AES handle.

What I REALLY need is a way to get a program's VDI handles be knowing its AES
handle....

Thanks anyway...

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Voltage has nothing to do with safety. Ever see Dave Small grab a hold of
is extremely high voltage Tesla coil? It's the *AMPS* or current that
will get you. So despite all the high-voltage warnings on monitors and
TVs, it's the stored charge that can unleash lethal current to watch out
for. Be sure to drain it off properly before proceeding.

2085. DTA Question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-23 08:57:12 UTC
From: Mojo <mo@sna.co.umist.ac.uk>
Message-ID: <1994Apr23.085712.18505@nessie.mcc.ac.uk>
Source record: 33161

Is the DTA a shared resource, or does each process has its own DTA?

The Atari Compendium
states that DTA is initially set to the same area of the command-line
which implies that
the DTA is local. My other docs imply that it is shared as their listings
restore the
DTA address when the process has finished with it.

Thanks in advance,

Jakes

>It looks like it'll be some work in order to get a GEM version of
>Mosaic or WWW.

It merely needs two things:-

(1) A standard networking API (ie MiNTnet when it's more fully implemented)
(2) The windowing/display interface being written.

The rest can be taken from the core Mosaic/WWW sources.

>Still, TCP-IP software exists for the ST! GNU emacs 18.5x runs on the
>ST (with or without MinT). I do not know how well this emacs
>interfaces with the TCP-IP stuff.

Now.. what the heck has Emacs got to do with networking? Emacs is an editor
which uses a type of lisp as a macro language, that's all. The networking
layer is far lower.

>Now, I just installed W3 (version 2.1.14), the emacs lisp WWW client,
>on my Sun and it should port as easily as other emacs packages.

Assuming the version of Emacs has been built to include the code which sits
atop the networking API.

>Somebody should try it on their Atari that has emacs and connectivity!

Erm... the Atari version of Emacs hasn't been built with the code to do this
as you need the networking libraries to exist to do so.

2089. Problems installing MINT and MINIX

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-23 14:07:45 UTC
From: gustavo@dent.uchicago.edu
Message-ID: <1994Apr23.140745.23325@midway.uchicago.edu>
Source record: 33167

Hi!
Yesterday I made an attempt at installing MINT and MINIX on my
Mega 4, and while MINT and several of the utilities that come in the
distribution package work well, I don't seem to be able access any of
the features that make MINIX better than the TOS file system. In other
words, file names get truncated to eight characters, and the shells
don't seem to see any difference between upper- and lowercase. All
this in spite of the fact that I chose the MINIX and not the TOS
filesystem option in SETUP.PRG, and that bootup sequence shows the
MINIX driver starting up. Also, I am able to acccess the partition even
when MINT is not running, which seems to indicate that what is there
is a garden variety TOS partition and not the MINIX one I meant to
install. Obviously, I must be doing something wrong, but I can't
figure out what. I have done the whole installation twice, scrupulously
following all the instructions that come with the distribution, with
no luck at all. Maybe there is some environment variable that I am
unaware of that has to be set before I can access the UNIX-like
features of MINIX? Could there be some incompatibility with the ICD
AdSpeed accelerator board that I am using. Also, I am using the ICD
controller and software to drive my hard disk, and the documentation
said something about MINIX and ICD software not getting along well,
but the desciption of the potential problems sounded more like the
whole partition would be trashed, rather than behaving like a TOS
partition. Does anyone have any ideas, hints, etc., to help me out?
Thanks in advance.

Gustavo

So, who else will help? Warwick's already donated GIF and IMG loading classes (well, the IMG class is in GEM++ already); I'll start looking at what we can snarf from Mosaic's code (libhtml anyway; will probably get some more ideas by looking at the code) this week.

What else do we need? At least an Atari .SPL sample player (preferably one that will work on normal STs and use DMA sound on machines with the hardware). Hmm, probably a few other things (if someone wants to create a GEM metafile drawing class for GEM++, I'd be really happy!), too.

As far as I know, the only way to network (ie, real live Ethernet) and
Atari is with an expensive VME card.

No one's written software to use the AppleTalk port to connect to an
AppleTalk LAN.

Now, if coding for SLIP or whatever is transparent to me (ie, link with
MiNTnet or something), no problem, it'll support it. If I have to go
through hoops due to the lack of networking on Ataris, it won't happen;
someone else will have to do it.

Sounds good. Pity file locking isn't standard on Ataris (as far as I
know, you need to load MiNT) or you could use a gdbm database (I dropped
the lib on atari.archive a while ago; should be in Mint/Lib/gdbm*.zoo)
instead of separate .KEY files. gdbm supports variable sized keys and
variable sized data chunks, so the key could be the program name (ex,
"GEM-View 2") and the data could be whatever the program wanted (ex,
"Registered to Krusty the Klown").

Something a bit similar to this was being discussed on the MiNT mailing
list a while ago; they were trying to figure out a standard place to
sick program configuration information.

> Anyone wants it, let me know. It's unsupported though.

That reminds me; I was going to modify it to allow normal text in those
.MNU files, so I can have:

```
File
"Shell" "!" 0000
"Options" "O" 0000
---
"Save Game" "Sy" 0000
---
"Quit" "Qy" 0000
```

in my nethack.mnu instead of those damn scancodes... Then I can have an
st52.mnu that lists my frequently-used phone numbers... that sort of
thing is hell to do with scancodes.

From: js10039@hermes.cam.ac.uk
Message-ID: <js10039.22.00116D07@hermes.cam.ac.uk>
Source record: 33177
Body handling: Inline uuencoded payload not displayed: 25MEX.PRG

As advertised, this program fools the STe's TOS into working with 2.5Mb of SIMMs installed.

Put it as the first item in your \AUTO folder, and make sure it is run immediately after every hard boot (otherwise TOS thinks its really got 4Mb installed and completely mucks up its memory management. Remember, the stack and screen (plus any reset proof ram disks are stored at the top of memory)) To boot a game, etc, hard boot your machine, when the install message displays, swap the disk with 25MEX.PRG with your game disk and it should load as normal.

This proggy will work with the SIMMs either way round (2Mb in bank 1, .5Mb in bank 2, or vice-versa).

[Inline uuencoded payload not displayed: 25MEX.PRG]

The one given on ST Format's cover disk a while back is broken - It is incompatible with anything that allocates high memory at boot time, and doesn't actually work depending on how you installed your SIMMs.

Hi! I work at a place that has 6 Ataris networked - 4 Falcon 030s and 2 TTs. We use Universal Network 1.02, which is supposed to be Falcon unfriendly, but I got it to work anyway. Anyone else use this software? I got to talk to the programmer who is doing the update and he said that he didn't know how it could work...

A clue might be that it refuses to work on a Falcon if you are using ICD Pro hd drivers...

If anyone has comments, please e-mail me.

You need to do two things (well, I do, anyways :-) Run mfsconf.ttp
from the mint.cnf. I have the following for each minix partiton:

exec c:\mint\mfsconf.ttp g: -d n -l n -s n -x t

And you need to have the UNIXMODE environment variable set properly
(again, in my mint.cnf file):

setenv UNIXMODE=cu/rUx

Other folks setups may vary. But it's a starting point...

>Also, I am able to acccess the partition even
>when MINT is not running, which seems to indicate that what is there
>is a garden variety TOS partition and not the MINIX one I meant to
>install.

I can also access my minix partitions without MiNT loaded in
(but I can't see my minix stuff, as minix.xfs is not loaded). You
might be risking corrupting the stuff on that partition if you try writing
to that partition without minix.xfs loaded (maybe?)...

>Could there be some incompatibility with the ICD
>AdSpeed accelerator board that I am using.

I dunno. However, I run fine in 16mhz mode on my MegaSTe...

Hope this helps...

Late last summer, there was a discussion about Gopher on the ST. I know that someone had compiled it and was running it. Are you still around? Does anyone know who it was, or are any of you using it?

I want this for inclusion on the FAQ that I am putting together. So any info would be appreciated.

Also what should I call the FAQ? I have been calling it a SLIP FAQ, but it looks like it is going to go beyond just SLIP. Should I keep this title for ease of recognition to new users or change it to something else more appropriate?

Thanks,

Dan Ackerman

And as we all know, the current is relative to the resistance in the circuit. The normal skin resistance is a couple of hundred kilo ohms so with a switched off monitor or TV set there is very little potential danger. Just let the thing 'cool' down for a few minutes and then the risk will be very low. DON'T try to discharge anything (especially not the picture tube!! It will scare the **** out of you if you haven't done this before!!!) In the act of discharging lies the biggest danger. As long as you don't pull the cap with the high tension cable off the tube, there will be hardly any danger. In monochrome monitors the voltages which drive the tube on the backend are gone as soon as you switch the set off, the high voltage on (under) the cap will be around 15 to 20 kilovolts (!!) when the set is ACTIVE, normally (as safety regulations require) this will bleed off after about 10 to 15 minutes (but this is were you'll never have to get anyway.)

>will get you.

If we assume most individuals have a relatively constant resistance (when dry), the amount of current you get hit with is directly proportional to the voltage difference you find yourself in the middle of. The voltage difference is the _cause_ of the current, so it's silly to say you shouldn't care about it.

Notice I said ``difference'' in voltage. Ostensibly, it's O.K. to grab on to something at a ``high'' voltage, so long as you are well insulated from anything else that might be at a ``low'' voltage. However, I don't recommend experimenting with this concept, since you never know when you might discover you weren't as well insulated as you thought.

Something else to know is that the flow of current can often cause the voltage difference to decrease. (Intuitively, think of the way a battery loses power over time.) So if the ``high'' voltage object has only a small charge (yes, this is possible), then the danger may be less because the charge dissipates rapidly and the voltage quickly decreases. I wouldn't want to rely on this, however. How quickly the voltage difference drops depends on the initial amount of charge and whether it is being replenished (as it is, say, with the electric power we are all familiar with). A natural electric shock can be hundreds if not thousands of volts, but the charge does not last very long. On the other hand, car batteries carry a very large charge, but are only 12 V. In theory, IF YOU ARE DRY, it should be safe to touch both terminals of a car battery. (I say ``in theory'' because I can't recall doing it myself. Perhaps I have and didn't notice. It may also be safe when you are wet; I'm just not sure how deadly 12 V is.) Small 9 V batteries never pose a deadly threat because they certainly can't sustain enough current to kill you. The voltage drops correspondingly.

Apparently most of the resistance in the human body is in the skin, and this ONLY WHEN THE SKIN IS DRY. Wet skin offers much less resistance, so the same voltage will result in more deadly current than when your skin is dry. This is part of why ordinary electrical appliances are so much more deadly in the bathroom. (Where I live, bathroom electrical outlets in apartments are required to have their own built-in circuit breakers.)

So, _yes_ you care about current, but _yes_ you also care about voltage, because it's the voltage difference that causes a current.

Three Strikes and We're Broke.

Actually, any battery over 6v can be dangerous if it can supply enough current. You can lick a 9v battery because it's a little dinky thing. A car battery, on the other hand, can supply a continuous large amount of current, and can be quite dangerous if you touch it while wet.

From just about everything connected to the Falcon's memory, there is a 32 bit datapath. However, to make for better compatibility and/or because they ran out of pins on the COMBEL chip, the 68030 in the Falcon is connected to the COMBEL by a 16 bit datapath, and the COMBEL is connected to memory by a 32bit datapath.

The Falcon030 has a 32-bit SYSTEM bus, but the 68030 is only
connected to 16 bits of it.

From: Atari-ST Software <atari@cs.ruu.nl>
To: cb170@city.ac.uk
Subject: Re: SM124 Monitor Problem

In comp.sys.atari.st.tech you write:

>Can anyone help me with a problem with my SM124?
>Normally the monitor works fine, but if there is only a little bit of white on
>the screen (ie predominantly black), what white is there fades.
>So, if I have a white letter G in the middle of a black screen, the G fades
>after about a second until it virtually dissapears.
>Is this an easy to fix/common problem?
Yes and yes.
Most of the SM124's I've seen have this problem. And it is easy to fix if you
know how to handle a soldering iron.

>From a few old comp.sys.atari.st articles:

| MINIX defaults to a white-on-black display. This can tend to underdrive
| the high-res SM125 b&w monitor. The symptom of this is the display
| fading and the need to increase the brightness level.
| The reason is that, under low drive, the CRT cathode wanders from its
| optimum 70V to 80V. The condition can be rectified(!) by putting a
| 70V zener on the cathode.

| I have installed the suggested zener diodes on one of my monitors, and
| the problem has vanished as advertised. Inspired by this success, I

| tried a similar, simpler solution. I have installed a simple 33 kilohm
| resistor between B2 and ground. It draws just 2 milliamps, which is enough
| to keep the voltage between 68 and 72 volts. The screen is just as stable
| as with the zeners, and 33 K resistors are a lot easier to find then 72 V
| zeners. Any value from 33K to 100K seems to do the job.

I have installed the 33K resistor in 8 or 9 SM124's and they all work fine
now. You have to solder the resistor between the cathode (B2) and ground.
This is on the little piece of circuit board at the end of the display tube.
B2 is marked on the print, and ground is the track around the whole print.

I hope this decription is sufficient to fix the problem. Please mail me if
you need more help.

2111. Re: SIMMS & STe memory sizing (was Re: SIMMS)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-24 08:58:09 UTC
From: ekl@sdf.lonestar.org
Message-ID: <CorA8x.Dqs@sdf.lonestar.org>
Source record: 33019

The STE and all ATARI 68K machines are limited to 4MB of RAM because of the MMU. Its really not an MMU. It contains the logic to access the RAM chips and determine when ROM is accessed, and I think it also has logic to let the video system get at the RAM chips and let the hard disk do DMA, it the equivalent of the COMBEL in the Falcon.

The MMU is limited to 4MB because allowing 16MB would mean more pins and that means more money - back when 256K was alot of RAM and Microsoft was saying "no one could ever use 640K" ATARI was designing the MMU - and they decided that no more address lines would be needed.

They also put a speed limit on it. It accesses memory no faster than 120ms, actually it may be 125ms, since 8Mhz is a pulse every 125ms (they could have gotten away with less I bet since the 68K can't access memory every cycle, but long fetches would get weird if wasn't at least as fast as 125ms). You can use faster SIMMs, (8/9/ or 3 chip) but they just get accessed at 120-125ns Whoops - I've been typing ms up there - should be 125ns and 120ns, etc, not ms!

DRAM refresh is done by the video circuitry since the video gets RAM access at regular intervals (on a faster clock too I think so that video and memory can interleave accesses - again, it takes the 68K 4 cycles for an instruction, so the RAM won't have to be all that fast - the Video refreshes as long as it has the bus anyway.

Lesee here.. I think that's about it. This is all conjecture on my part BTW, but from what I know of hardware combined with what I've heard about how the ST handles RAM and the 68K timings, etc. Adding more than 4MB would mean adding your own decode logic so that addresses within the 4MB to 12MB space get latched to your own memory control logic and RAM chips and everything above and below goes to the MMU. It can be done, but it would be kinda messy, and you couldn't get more than the 4-12MB, since everything above 12 doesn't work out nicely in binary :-) and some of that is hardware and ROM.

2112. Re: VDI and AES handles

Newsgroup: comp.sys.atari.st.tech

sdenman@wolf.cs.washington.edu (Stuart Denman) writes:
>Is there any way to get the AES handle of another running program when all
>you know is its VDI handle? How about getting the VDI handle by just knowing
>its AES handle?
>

Think about it. Every Application has 1 AES handle, but can have many VDI
handles. Its not a 1-1 mapping. Besides, the only program that needs that
info is the program that uses the handle, and you shouldn't use another
person's handle without asking.

>For example, if I wanted to send a message to a program to re-draw its
>windows, and didn't want to send it to all the running programs, I could
>search for its AES handle by knowing the file name (e.g. NEODESK).

This is easy to do. No problem.

>Don't ask why, but I also need to know the handle of its VDI screen
>workstation.

I know you said not to, but I'm gonna ask. Why do you need to know the
VDI screen workstation? Just use a standard GEM redraw message! Perhaps
you could tell me EXACTLY what your trying to do and I could help better.
You can get the window handle, and the reciever can do its own window-VDI
conversions (assuming it assigns each window its own handle, instead of
a global allocation or some wierd method).

>To repeat:
>So is there any way to get the VDI handle, knowing the AES handle?
>Or, if I just know the VDI handle, how can I get the AES handle?

To repeat:
NO - not through the OS, although you could ASK the reciever assuming you
implement the protocol yourself, but in general, NO.

>host adapter.

Hi....Is the 7120 AT an IDE drive? If so, it won't work. I have a
Maxtor 7120S (SCSI) drive working with an ICD AdSCSI Plus, and have had no
problems whatsoever. You just have to make sure the drive is set to an
ID other than 7,0. Technically, the MicroST adapter is the same as what
I'm running.

Yes, instant platform-independant hypertext that can be created by
anyone with a text editor would certainly be a waste of time on the
Atari...

> If you cannot support links to other machines (and there are some excellent
> non-graphic HTML clients, such as Lynx...), you're NOT creating a WWW client,
> you're creating a non-compatible "program" which will ensure that ST users
> remain in a tiny Internet ghetto by themselves.

I'm not writing a WWW client, I'm writing an HTML (or possibly HTML+)
object; it'll parse and render HTML documents, and that's it. Inline
graphics and sound will depend on whatever I or other people can set up;
for example, Sun sounds are (AFAIK) impossible to play on an
ST/STe/TT/Falcon... if someone else wants to create a player and give me
the source code, it'll be in there. Warwick's already given me a GIF
loader, and there is already an IMG class (that'll load files) in GEM++.

If you think of HTML as just the World-Wide Web dialect, you're missing
out on a lot of potential; I'm going to push for an HTML widget for
Mosaic and Windoze at work, since our organization is moving towards
SGML for a lot of things.

You mean even the blitter is 32 bit ? Come on, why is it so slow then ?
What's the use of connecting a 32 bit processor to a 32 bit system bus
through a 16 bit funnel ? I'm not sure but as far as I know the whole
Falcon is only 16 bit wide, including blitter... In the 'official'
announcing of the Falcon it was said it would be 32 bit. But then again, at
the time the TT was announced, it would have had 1280x1024 true color
a fast blitter etc...

This is not the Drag & Drop protocol. This requires MiNT and uses
Psignal() to pass portions of text or image data between _active_
applications.

Chris, check out the source code (available in various places)
for "sox" - it's a sound file converter, which I believe can convert
sounds between Sun (.au), .wav, .snd, and other formats. You could
probably figure out the .au format from those sources (or perhaps
include an internal ".au to .snd" conversion and just play
the .snd)...

As several of you properly pointed out, even relatively low voltages and
and currents can be deadly. It is worth repeating the standard disclaimers:
Do not work on your monitor unless you are fully qualified to work with
high voltage ciruits. My statement should have emphasized that the B2
circuit can be worked on with ordinary tools if you have the proper
safety training. It is closely surrounded by much more dangerous
circuits. The circuit fix is very easy to perform, just a 33K resistor from
B2 to ground, as noted in another followup. If you have to ask whether
you're qualified to do this, then don't try. It is a 5-minute job for a
qualified person.

Source record: 33101

Dear everybody,

sorry, maybe this has been asked quite a few tiimes already recently,
but I`m still not enlightend:

I`d like to use a CD-ROM with my Falcon, so what do I need?

Where can I get the necessary driver for example?

Would it be possible to look at the pictures from a CD using GEM-VIEW?

I`ve heard that the Apple CD300 works fine, what about the PowerCD-thing?

Here in JApan they sell a bare Toshiba XM3401B drive (internal version), and no
external (i.e. with case, powersupply etc). Could I use that too? I mean, if
I figure which pins must go to which SCSI-connector pins?

Wouldn`t any SCSI-CD=ROM be fine?

Many thanks in advance,

Christian

Knowing why you want only one app to redraw itself might help! And why
would knowing which VDI handles the app has got help at all?

If you just want the one app to redraw, then you could send *it* a
WM_REDRAW message which covers the whole screen (using appl_write()).
You'd have to know the app's AES ID somehow, perhaps by appl_find().

No, it requires a pipe (U:\PIPE\DRAGDROP.xx, where xx = AES app ID) be
opened (Fopen) by the initiating app, which then passes a handle to it
to the receiving app. All communication is via this bidirectional
pipe. Psignal is nothing to do with it, unless you're initiating the
DnD and don't want to terminate when the pipe gets closed :-)

Is there such a thing as a C interpreter? Surly it would be too slow with
having to include all the header files and libraries etc..

I've just started to dable with Sozobon C which is PD, my version is pretty
old and doesn't include libraries for GEM - but I think I have seen these
libraries around.

Don't know if this is a good compiler or not - but it does what I need

Better yet, use a shell compiled for MiNT, i.e. that runs in the MiNT domain.

Hello

How do I network an ST in an ethernet environment?

Here at work at HENSA/micros, all the other computers are networked, and the only way to network from this office is via ethernet. I am hoping to network the Mega ST2, and hopefully a Falcon when we get one.

BTW, there is a SUN sitting in the room too, maybe a serial network could work. However, this I fear maybe too slow.

Any ideas?

Danny.

Fine. Just don't continue to use a Subject line that refers to Mosaic/WWW
clients! Your comments about in-line JPEG pictures and Atari-specific sound
files _in_the_context_of_the_subject_line_ deserved the comments I made.

I would also caution you that, without SOME standardization, HTML documents
created using your conception of 'platform-independent hypertext' are going
to be anything but 'platform-independent'.

2138. GDB with G++ Question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-25 20:08:19 UTC
From: pstoaks@spider.mentorg.com
Message-ID: <2ph7vj$jau@hpbab.mentorg.com>
Source record: 33014

I would like to use GDB with G++ but I am missing some information. The gdb docs say to use the '-g' switch to the compiler to get symbol information, which it strongly suggests will appear in a different output file that ends in '.sym'. When I use the -g switch with G++, I don't get any files except the expected '.o's. If I try to invoke gdb on the program ignoring the need for a symbol file, I get an error stating that the file is not in executable format. (The program does run from Bash.)

Anyone know how to do this?

As a related question, where can one find a MAN page for the g++ compiler?

Thanks,
paul

>However, this I fear maybe too slow.

Well with a bit of luck you could use MiNT-NET and Ulrich's NFS accross
a serial link to the SUN. The SUN would then route onto the main network
for the Atari.

Whether the software is up to it yet I don't know. I still haven't managed
to network 2 Ataris properly, but I'm hopeful.

>
>Gert
>

I do believe the blitter is 32 bit. It's slow because it has to share bus bandwidth with everything else. You can put it in HOG mode, but it takes over the bus and essential interrupts don't get to run, etc... screws things up.

One of the biggest speed bottlenecks for a processor is memory access time. Therefore, a processor will access memory twice as fast when reading from a 32 bit bus whenever it reads a 32 bit word. So, you ask, the Falcon then runs at a slow bus speed? Not exactly. The COMBEL does the memory access for the 68030 and does it 32 bit, and the 68030 can read from the COMBEL faster than it can read from RAM. So, in THEORY, the 68030 goes to read a long word...the first half is read with the normal delay, but when it goes to read the second half, it's already in the COMBEL so can be read without the normal delay. While this isn't as fast as reading 32 bits directly, if it's possible for the 68030 to do what I'm suggesting, then the Falcon at least reads faster than a 16 bit bus normally would.

Now, when you get to Intel, the instruction execution time is the bottleneck, so we don't bother with the memory access time. <grin>

Not quite, you only need to check for the _FLK cookie, which other
GEMDOS extensions could add themselves. However, the mode bits in
Fopen for file locking were probably only *documented* recently...

There are SCSI-based ethernet adaptors available, which are used by Apple
Mac PowerBooks. It all depends upon the manufacturer's willingness to
publish the commands whether such a unit could be used by any Atari, using
either ACSI via an adaptor or SCSI on the TT and Falcon. These Ethernet
adpators cost about 150 punds in the UK. Admittedly an internal board would
be best.

Help!!!

My 1040STe is trying to dye. I have 2meg RAM, original floppy,SC1224,
ICD host, and a Maxtor 245s HD.

It boots fine but after running anything from the desktop it goes crazy.
Some times I get 2 bombs, sometimes 3, a few times 11, and other times
no bombs. I have found no relation between programs and number of
bombs.

If I get no bombs the desktop gets fried. All windows are closed, drive
icons in uper left, and the only drives available are A,B,& C. Originaly
I had drives A, C-J installed. Using SYSINF83 afterwards shows that my
DESKTOP.INF file is still in memory. If I change resolutions the desktop
is restored. I have changed my ram back to 1meg and tryed 512K, using SIMMs
the work perfect in other machines. No change. Booted from floppy. Same.
Booted without HD. Same.

I used the Sebra Mono emulator and have no problems in Hi-Res.
Anyone got _ANY_ ideas?

thanks,

Thomas

Not the compiler generates the symbol file, but a special a linker,
called sym-ld. This is just a variant of the normal linker, only that
it puts out gnu-out format files instead of st-out. That means that
you have to link your program twice, once with the normal linker to
produce the executable, and once with sym-ld to get the symbol file.
This cannot be avoided, since the st-out format is too limited to
provide the necessary information for gdb. Btw, which version of gdb
are you using?

2151. Mega STe & SCSI question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-26 12:09:37 UTC
From: jules@cs.ruu.nl
Message-ID: <Cov8G2.M1C@cs.ruu.nl>
Source record: 33027

I understood that the Mega STe has a factory built-in SCSI adaptor
(unlike the 1040 STe and all of the ST's). Does this mean that it
is possible to replace the built-in harddisk by any SCSI harddisk?
Also does this allow for additional SCSI peripherals to be connected
to the computer, and if so, how?

Thanks in advance,

-- Jules

No, there isn't a factory built-in adaptor. You have to buy one.
Most of them allow only one SCSI device, some of them allow 8.

Try comp.sys.m68k. Its probably in the FAQ there.

Sounds like you've got a conflict in you Auto folder and/or desk accessories.

Bypass your hard drive during boot. If your system runs fine from floppies
run ICDBOOT.PRG, and install your C drive icon. Try running a few programs.
If you start having problems your host adapter or cable is bad.

If everything is still Ok disable every desk accessory and reboot from the HD.
If it works then find the offending ACC/CPX and get rid of it. If it starts
messing up repeat the floppy boot and try cleaning out your auto folder.

Do not forget to replace C:\ICDBOOT.SYS by using HDUTIL.PRG

J. Sullivan (js10039@hermes.cam.ac.uk) wrote:
:> >>and why the 4m limit
:> >>since the 68000 can access 16M directly?

Because the MMU is limited to 4MB.
A different MMU can access 14 MB (the other 2MB are under the ROM / Hardregs).

:> >>What is the slowest SIMM
:> >>a STe can use without slowing down the processor.

A too slow SIMM doesn't slow down the processor - it just won't work. No timing checks. The SIMMs ATARI uses are 120 and 150 ns, so that should be safe.

:> >> ANY info is helpful, schematics, timing diagrams, or
:> >>where to find this info is what i really need.

I found sth in ST computer in the article where they described the 3MB memory expansion.

:> Me too! Especially: Pin outs (are these standard anyway between 3 chip & 8/9
:> chip simms?)

Yes, they are standard. And the difference between 256-1M-4M-16M are one adress line more each.

Timing (do you have to make sure you test for timing and don't
:> run them to fast, or is there a decent data transfer protocol where they let
:> you know when the data you requested is ready?)

No protocol. Just try&error :)

Refresh (they're DRAM so I
:> assume you have to do it, but HOW? Never got this.)

_I_ wanna know this too. Cause I want to build my own 14M extension :)
That means, I need some info about DRAM controllers. Where to get them, pinouts etc.

:> Test to see if same data appears at $[0/2]80008 = 512K bank
128K.
:> " " " $[1/3]00008 = 1M bank
512K.
:> Otherwise 2Mb bank.

That error is in ALL STE's up to TOS 2.06. But only STE, if you have an ST with 2.06, it will work. Due to a problem with damn IMP bugs in some STE chipsets.

> Is there any way to get the AES handle of another running program when all
> you know is its VDI handle? How about getting the VDI handle by just knowing
> its AES handle?

There is no such thing like another program's VDI handle. There is an AES-Handle (AES-ID) for every running GEM program, and you can figure it out by using the "appl_find" function of the AES, just knowing the program filename. A simple call of "appl_write" is enough to send any message to that program. However, trying to force a redraw of a single window you encounter a problem : You don't know the AES window handle, and there is no supported way to find out.

The VDI handle is a different handle again, and has nothing to do with the AES handles mentioned above.

> To repeat:
> So is there any way to get the VDI handle, knowing the AES handle?

No. You would have to ask the VDI, but the VDI doesn't distinguish between different AES processes, therefore it doesn't know what to do with the AES handle provided by you.

> Or, if I just know the VDI handle, how can I get the AES handle?

Not at all using the VDI handle, but doing "appl_find".

I paid about $125 CDN for the Mega ST TEC bus board that was pretty much a snap
to install. It's a little more tricky if you want to run your existing TOS and
TOS 2.06 but it's not that difficult. I believe I got it from Gribnif
(413-247-5620). There are others out there as well.

Actually, some MegaSTE's (those that came with hard disks) have an internal host adaptor, but they are a plug in affair that is available separately (along with the special plastic housing for a 3.5" disk). So, this is not much different from other internal host adaptors that are available.

Now, in answer to your question, you should be able to replace the 50mb hard drive that came with MegaSTE's (so equiped) with any 3.5" SCSI device, given that you can set parity properly. Some devices do not have parity jumpers anymore, you have to set them via software (from a machine that can do parity). So, the only thing to watch out for is a lack of parity jumpers. Very fast SCSI-2 devices might have problems, I'm not sure.

This does not allow you to connect additional SCSI devices without purchasing another host adaptor, unfortunately. The Atari internal unit can only handle one device (and it must be set to 0, I think). External host adaptors are not very expensive, though.

I believe the software upgrade to 3.0 is very inexpensive (if not free,
minus shipping). I could be wrong, as I bought mine with 3.0 software
included, but my impression was that software upgrades would not incur
any major cost.

As noted before, version 3.1 should be out "real soon now".

Source record: 33095

I have a Mega STe with an ATARI internal host. It currently has a Segate 30 meg drive in it. It works fine but the Segate is on it's last legs (stiction from hell!) and I want to replace it with a Quantum 40 meg drive that I have.

The Quantum works with my ICD Advantage external host but when I hook it up to the internal host, the driver refuses to recognize that there is a hard drive on the system.

Do I need a new version of the ATARI Hard drive driver or is this config just never going to work?

Thanks.

P.S. What the heck is that three dip switch package for on the internal host adapter board?

This is WRONG! That is simply starting an app. Drag-n-drop uses
a combination of MiNT PIPES and GEM messages to allow one to mark data
in any window and drag it into any other window - even if the window is
owned by another application. You can drag text, graphics, speadsheet,
info, whatever. I have the info, but do not have the time to type it.
Get the Compendium.

Yes, definately. MiNTnet should provide (1), GEM++ provides the basis on
which (2) can be built. This is why it is a Good Thing for Chris to tackle
a local-only version first, as then (1) can be simply connected.

>------------------------------
>
>

NOPE! Doesn't use signals at alli, well, it uses Psignal to mask off
SIGPIPE signals. Signals just notify an app of some sort of pressing
immediate condition. Drag-n-drop uses pipes. I guess I better do a
brief explanation of what's involved.

1 - Neither app should lock the screen with wind_update.
2 - The originator :
a - When a user drops data with the mouse, use wind_find to determine
which window (could be 0 to drag to the desktop) the data was dropped
on.
b - Use wind_get to determine the AES handle (from the window handle
returned by wind_get)
c - Call Psignal(SIGPIPE,SIG_IGN); to ignore sigpipe signals. You may
want to save the old value and re-instate it. The defaultis either
to die or ignore (I forget).
d - Create a pipe named DRAGDROP.xx where xx is a unique 2 letter combination
You do this with an Fcreate on U:\PIPE\DRAGDROP.xx with its "hidden"
attribute set, so read return EOF when the other end is closed. To
ensure uniqueness, use the ASCII representation of your own GEM APP ID.
e - Use appl_write to send an AES message to the application with the
following info (app is the target, or recipient) :
WORD Contents

0 AP_DRAGDROP (63)
1 Originators App ID
2 0
3 Window Handle of the Target
4 Mouse X pos. at time of drop (from the evnt_multi)
5 Mouse Y pos. " " " " " " " "
6 Keyboard shift status at time of drop.
7 2 character pipe ID packed into a word (extension used above)
f - Originator uses Fselect to wait for a write to the pipe or a timeout
3 to 4 seconds should be enough.
g - If the call times out. Close the pipe, otherwise read 1 byte from the
pipe. DD_NAK (1) or DD_OK(0).
h - If DD_NAK, close the pipe. Recipient wasn't prepared for drop to that
window.
i - If OK, read 32 bytes from the pipe. These are the 8 preferred data
types that the recipient can handle. If less than 8, they will be
zero padded. Disk file types, like ".GEM" or ".IMG" or ".TXT" contain
the leading period (ascii representation of longwords). Things like
"ARGS" or "PATH" are special and need not containthe leading period.
j - If a user drags files from a desktop window to an application window,
the "ARGS" type is used. Data will be a standard argument string,
in TOS 8+3 format with filenames bracketed in single-quotes with 2
single-quotes to delimit a single quote in the name.
k - Construct a structure as follows :
1 - type of data you decided to send - longword
2 - length of data in bytes - longword
3 - Data name in ascii format, null terminated, - used for icon label
4 - Filename the data is associated with, null terinated
l - Write a word to the pipe signifying the length of the header, followed
by the header itself (pipes are bi-directional).
m - The recipient will write 1 byte indicating a return code, as follows:
NAME VALUE MEANING
DD_OK 0 Ready to recieve, fwrite the actual data, + close
DD_NAK 1 Abort drag-n-drop, close pipe + abort.
DD_EXT 2 Recipient cannot accept that data, either construct
a new header, or abort (note that a header does
NOT have to be one of the 8 preferred types, but
using a preferred type is best).
DD_LEN 3 Cannot handle so much data, either use a format with
less data or close pipe and abort
DD_TRASH 4 Data has been dropped on a trashcan - close pipe
and delete data.
DD_PRINTER 5 The data has been dropped on a printer. Pipe should
be closed and data should be printed (by originator)x
DD_CLIPBOARD 6 Data has been dropped to clipboard. Close pipe and
use a "Copy" clipboard operation (not CUT)

Exception - if using "PATH" data type and recipient agrees (DD_OK) then
originator should READ a path string (null terinated) and should be a
full path as represented by the target window.

The recipient works in reverse.

They do exist (there's one called C-Breeze and one called C-Envy I
think), but I have no idea how they work... They're probably quite fine
for learning C syntax (pointers can be hell until you figure them out,
especially on a machine without memory protection).

That's pretty much the definition of a good compiler. If you grab Heat
& Serve C 1.33i (hsc133i.*? on atari.archive? down in Languages), it's
a decent C compiler, with nice GEM libraries.

>a fast blitter etc...

Yes, the Blitter is only 16-bit. However, the SYSTEM bus is 32-bit.
That's why bypassing the Blitter for some graphics processing is
actually faster -- because you can pass 32 bits of data directly to
the VIDEL, rather than only 16 bits via the Blitter.

The Falcon030's specs are one of the few instances where I find that
Atari is being purposely misleading -- they claim "BUS: 32-bit data,
32-bit address" as part of the System Architecture, but then when
challenged, Atari says they are just talking about the 68030's
INTERNAL architecture. In my opinion, Atari has just been flat-out
LYING about this.

THEORETICALLY, any SCSI CD-ROM drive should work fine, but that's
not the case. That's not Atari's fault, but there are just subtle
differences between CD-ROM drives which require driver software to
written to more specifically for that drive. Though I don't have
it handy, I HAVE seen a few lists of CD-ROM drives that ARE
compatible with MetaDOS (MiNT .XFS CD-ROM drivers and ExtenDOS will
handle more drives, though).

Also, a "very inexpensive" double-speed CD-ROM drive that connects
to the ST/TT/Falcon's cartridge port is supposed to be released
later this year.

|> :tcp header files...
|>
|> What is not clear to me: What does this X server support?

Well, I have not began work on the X server yet, only the library.
What I intend to do;
Get the libraries compiled.
Compile some of the X-client programs.
Test these programs through a serial line on a computer with an X-server.
(either via slip, term or something similar)
Start work on porting the server, probably based on the sun-
server.
|> - does it support not-local clients?
Yes, because it is based on the mintnet.
|> - does it support not-local clients connected by a modem?
Yup.
|> (These two probably do need serious mintnet support)
Correct assumption. Mintnet today supports connections between
computers via the serial line.
|> - does it run on a simple ST?
It should, however I am compiling this with gcc and -m68030...
|> - how much memory is needed?
To compile: Probably more than 8 Megabytes (I have 14 in my Falcon)
To run, difficult to say as nothing is runnable yet.
I believe it will work on a 4 Mb machine, but this is just a guess.
|> - is three button mouse emulation available?
Haven't come this far yet.
I will have a look at the mouse code in mgr, as this supports
three-button emulation I suppose I can use that.
The atari - even gem, supports mice with more than two
buttons though.
|> - how can we support this project?

Well, at first you will have to have a machine with lots of
memory - probably at least 14 Mbytes. You will also want
a quick machine. Preferably a TT.
Then you will have to have a big hard disk.
My x-source tree is now more than 100 Mb...

It started out at about 80 Mb, but now I have generated all the
fonts, and compiled most of the libraries and clients. I don't know
how much it will take in the end.
Of course the compiled, installed version will take much less
disk-space. These 100 megs includes all fonts, documentation, source
etc...
But this is rather handy to have ready when developing...

If anyone wants to help out on this project, I am more than willing to send
out the diffs I have made this far.

MetaDOS should work fine with all SCSI CD-ROMs but Atari's BOS driver doesn't
support Falcon SCSI. You'll have to get a third-party driver for that.

Mailing list owners and other with kill files may be interested in their
complete list of e-mail addresses:

cslaw@delphi.com
cslaw@win.net
cslaw@witchcraft.com
cslaw@pipeline.com
cslaw@netcom.com
cslaw@indirect.com (currently disabled)
lcanter@delphi.com
lcanter@win.net
lcanter@witchcraft.com
lcanter@pipeline.com
lcanter@indirect.com (currently disabled)
76636.443@compuserve.com

They also, apparently, have sites of their own; those sites are
lcanter.win.net and msiegel.win.net.

Add 'em to your kill file and they just go away. You might also try
subversion: re-post the ad but change the details (price, e-mail address,
phone number etc.) A great way of putting people off by spreading
disinformation.

Regards,

Mat

> to be anything but 'platform-independent'.

Why whould they? HTML is SGML; if I use a different tag for
Atari-specific inline images and sounds, other browsers will just ignore
it (unless, of course, they are bogus).

For example, the standard GIF, PostScript, or JPEG inline tag is:

<img src="http://foo.bar.com/bozo.gif" align="top">

(In fact, in my HTML docs, it says the graphic file has to be in one of
the following formats: GIF, JPEG, PS, [others may be implemented]...)

So, we use:

<atari-img src="http://localhost/c/www/images/bozo.img" align="top">

for IMG and GEM and whatever else. I seriously doubt that the HTML
specs limit you to using just GIF, JPEG, PS, etc... you'll just get
that Mosaic icon when it hits an image it can't interpret.

I'm still interested in how you think this might make my HTML files
incompatible with something...

2183. Lattice C in-line asm code ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-27 12:54:16 UTC
From: avsec@westminster.ac.uk
Message-ID: <Cox56H.LMq@westminster.ac.uk>
Source record: 33103

I recently got hold of some C source code.

I was written in Lazer C and had inline assembly code.

Something like

```
asm
(
stuff like move.l ......
)
```

is this possible with Lattice C ? Or do you have to make separate functions ?

Hmmm......
Phil.

2184. GCC-CC1PLUS with MINTNP/OLDGEM - Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-27 13:04:46 UTC
From: bernd@golem.nero.uni-bonn.de
Message-ID: <BERND.94Apr27130446@golem.nero.uni-bonn.de>
Source record: 33113

I installed GNU gcc 2.5.8 on a TT030, using
Minix-FS. Running MINTNP.PRG and OLDGEM.PRG (GEMINI 1.99),
I'm able to compile ANSI C-file (as "gcc something.c")
uebersetzen.

Problem is: if I try to compile a C++ source by

"gcc something.cc"

I get a full stop following some messages like:

pid 14 (gcc) BUS ERROR ...
pid 5 (GEMINI) BUS ERROR ...
pid 4 (OLDGEM) ILLEGAL INSTRUCTION ...
pid 16 (OLDGEM) BUS ERROR ...

The same configuration of gcc, GEMINI and MINT seem to
work correctly without OLDGEM, i.e. using the complete
MultiTOS/MINT enviroment (but I've only tried the
"Hello, world\n" class of programs at the moment).

Anybody familiar with this problem?
Anybody actually running gcc for C++
with MINTNP/OLDGEM and GEMINI?
Any ideas ?

Thanks in advance,

Bernd Kreimeier,

bernd@nero.uni-bonn.de

Hi friends

Got this tape backup unit connected to my Atari right now, and it connects to the printer port. Now, is there any way I can perform a backup? Gemar 2.20 is only for tape thingies that plug into the DMA/SCSI port.

Anyone know of any other PD/Shareware software for this. The tape drive connected is a trakker 250 MB.

I'd also like to test gemar to put on our archive, and this is not much help at the mo. 8(

BTW, micros.hensa.ac.uk has gone back to it's old machine, as the new one crashed and rebooted after the first hour. We are still waiting for SUN to come and fix the problem. Hopefully, the new machine will be on-line by Friday.

Thanx in advance.

Danny. =);-)

: is this possible with Lattice C ? Or do you have to make separate functions ?

I don't know about any newer versions of Lattice C, I use v 5 but not the
newer release, but my version can't.

The manual tells you how to combine C and assembly but (head hangs down in
shame) I couldn't understand it (or just didn't try hard enough).

But it sure wasn't inline. :-<

Lattice C comes with a slightly cut down devpac. You use that to build your ASM bits and then link it all together when you build the executable. This is fairly straightforward and the manual covers all that is required.

From: eldmw2@lut.ac.uk
Message-ID: <Cox816.6vM@lut.ac.uk>
Source record: 33135

In my search for the address of the floppy light, I dissassembled n_light.prg
I ended up with:

```
; light on
lea $ff8800,a0
move.b #14,(a0)
move.b #12,2(a0)
rts
; light off
lea $ff8800,a0
move.b #14,(a0)
move.b #14,2(a0)
rts
```

both subroutines being executed in supervisor mode. They do work, but...
I need to know what the names of these locations are, and why these values
are used. Each alternate pair of values either turns the light on or off

5.6 hasn't changed in this regard. I suspect you didn't entirely understand the chapter (aka 'page') on #pragma inline. Essentially, you have to write a pseudo function inside a #pragma line which simply contains a string of hex bytes. You are good at writing Motorola assembler code by hand, aren't you? Anyway, the string just gets inserted into the real stream of instructions whenever you 'call' the pseudo function. I think you also have to prototype the pseudo function beforehand as well.

A bit crappy, yes, but no worse than allowing inline assembler mnemonics IMHO.

Lattice C does not have the ability to handle inline assembly (due to the way it handles C code optimization), but it does have a very nice assembler and the manual documents how to inverface the two languages just fine.

>displaying unit 0 : type unknown.

I use a Gastiener Quantum 105Mb drive. The only problems I've had
were that originally it was too slow when writing - sometimes even slower than
writing to floppy. This was solved by changing to TOS 2.06, so I guess it
was not the drives fault. Incidentally, when the drive was first delivered,
the drive active light was not wired. I know Gast. drives are cheap but
surely they test them before delivery?

The driver software? Hah! Have you tried usign 'help', on my machine it
filled the screen with some german text and then bombed.

No back-up software was included, contrary to the advertisement and order.
I complained, they said they'd send me something. Errrmmm, that was summer '92
it's now summer '94. I knwo snail mail is slow but....

I gave up with their driver in the end,it wanted to grab 140k RAM as buffers.
I now use the Atari drivers. This allows me to format 4+partitions properly,
and no 16Mb limit. Yes, I know that Gast.'s driver does that but it fiddles
around with sector sizes or some such silly thing.

Move to the Atari driver.

2197. Help! Need SCSI for ST to MAXTOR

I got a great deal on a 760MB Maxtor SCSI. I know someone use to make an
interface but I don't know where to look.

2198. Opinions on Falcon towers wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-27 21:09:06 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <2pmk9i$b7f@nyheter.chalmers.se>
Source record: 33116

I've recently ordered a SCSI disk for my Falcon and am now looking for some kind of cabinet to put it in. So far I've not been able to find _any_ cabinet for less than 1200 SKr (about US $150), and of course they all come with a normal SCSI cable that I can't use. A proper cable seems to cost around $80.

These unbelievable prices have made me consider getting a tower case instead, since I also intend to buy an accelerator card in the not too distant future.

A local PC retailer claims he can get me a large PC tower, with PSU, for $250. To this would have to be added the price of a few cables and such. This tower is of course not designed with the Falcon in mind, but it might be possible to convert it with some work.

Then there are the Falcon towers advertised in the ST magazines. I have, however, not been able to find reviews of any of them, so it's hard to know if they're worth their price.

If anyone has any experience with converting a PC tower for the Falcon or knows anything about any of the towers sold specifically for the Falcon, I'd really appreciate some comments.

Hello,

We have some atari machines here. They ar not connected to the ethernet (Coax-BNC).

This is been uesd at the music dept. The Atari is most uesd to composing/arranging and in connetion with MIDI seqencers.

But we like to use the Atari on our post-net (tcp/ip) and also if possible the the fil-server IPX.

Is there anybody knowing what we "need" for doing this?

I understand we have a "Appletalk" connector and we may use som apple stuff or compatible. And other qestions is: Is ther any freeware or shareware drivers for this.

I hope some can give me tips, all kinds is wellcome.
I am on "the virgine land" here.

Kent

C-Breeze is an editor, not an interpreter. It is a rather splendid and very
configurable editor though. But its a little old. Don't know what C-Envy is
though.

I thought that HiSoft 'C' was the ONLY 'C' interpreter available on the ST.

I do know it's not the only one.
I have the "Interpreteur C" from Loriciels (french software house,
probably dead by now). It had an impressively fast editor, possibility
to "link" with compiled code and was pretty much ANSI.
Only trouble: it didn't seem to know about the "for(...)" construct
(kind of odd for a C interpreter and I never read or heard about that
specific problem and the example files used the "for" construct, but
still: my version always complained over "for" but was running fine if
the "for" was translated by hand into a "while")

Message-ID: <2poii1$9ht@insosf1.infonet.net>
Source record: 33134
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have the following items for sale:

1040STf 1Meg TOS 1.4 (6chip)
ADSCSI Plus adapter
SC1224 Color Monitor
SM124 Monochrome Monitor
Citizen 180D Printer
Practical Solutions Cordless Mouse (Wonderful)
Joystick
Hayes 1200 Baud (Joystick & Modem go with computer)

Software in Boxes, with Manuals

Arena
Hunt For Red October
Karate Kid II
Championship Wrestling
Dungeon Master (Great)
Out Run
Battle Chess
GBA Championship Backetball
Hard Driv'in II
Gone Fishin
GFA Basic 3.0 Editor/Compiler/DOCS
DBMan Version 2.0

All items can be yours for a reasonable offer. I really don't
want to put a price on them. I just want some offers. The best
offers get it. You can e-mail me at Lannie@ins.infonet.net,
or Lannie@data.infonet.net.

Everything listed is in good working order. The exception is the
printer. It works, but it is very used. The print quality is still
the same, but it's casing is a little worn.

: one adress line more each.

Actually - there is a small difference... They refresh differently.
This isn't a problem in the ST, it already has a 10 bit refresh
counter.. 4Mbit chips (used on 3 chip SIMMs) need all ten bits, where
1Mbit chips (on 9 chip SIMMs) use only nine bits...

Hi,

I was wondering if anyone out there actually knew if the
Falcon030's sound system was a true representation of 16bit or weather all
the rumours of the so called `Sound Curruption' where true..

Is the Falcon true CD quality ????

Mike...

In article <A23892@AC2>, CASTAN@cip.physik.uni-stuttgart.de (Gerd Castan) typed:

GC>No, there isn't a factory built-in adaptor. You have to buy one. Most
GC>of them allow only one SCSI device, some of them allow 8.

Of course the *Mega STE* has a built in SCSI-host. If it was shipped with a harddrive, that is. It has some major limitations, though.

It can only handle *one* drive and that has to be ID 0.

You can use the ACSI-DMA connector as well, but then you have to use an external host as well.

>be possible to convert it with some work.

In holland, a tower case can be bought for about Fl. 200,- (= about $ 120)
so $250 seems quite a lot. These prices are common on several computer
fairs. I recently bought a tower for my TT and it cost me (without a power
supply) Fl. 145,- (= about $85) I used an older 150 Watt PC supply which I
disassembled and of which only the PCB is mounted in the bottom of the
tower behind the front. A plate of aluminium is used to cover up the
opening for the power supply and in this plate I made an opening for the
fan.
The bottom two places for floppy or harddrives are not usable anymore
because of the size of the TT PCB but there is still room to mount the HD
and floppy drive in this limited space.
The two top places of the tower are occupied by a tapestreamer and a
CD-ROM.

You will have to do quite a lot of drilling and filing (?) to get the PCB
in a PC tower. I removed the frame which held the slotcover plates so the
TT PCB board lies flat against the backside.

>Then there are the Falcon towers advertised in the ST magazines. I have,
>however, not been able to find reviews of any of them, so it's hard to know
>if they're worth their price.

In holland a company called CoCo can deliver a Tower especially made for
the Falcon, it costs quite a lot: Fl. 525,- (= about $310) but then again
you won't have to drill any holes...

Yes, it is 16 bit, and it's better than CD quality (50khz). I hear it myself quite frequently, and I'm very impressed with it, even with my poor cheap speakers. There is a slight timing problem in the Falcon which causes such things as the time-clock to be a little slow, and other things like that. As a result, some of the other things in the computer aren't exactly right either, like 50khz MAY be more like 49.99khz, which is totally irrelevant. For all practical purposes, the Falcon sound system is wonderful, and any quirks can be ignored. It's no more buggy than your average Amiga.

DRAM refresh is done by the MMU...

There can be a problem with fitting 9 bit SIMMS to a STE or some memory
boards..

The Ninth bit should not be left floating, on a STE that I fitted SIMMS to, had
SIPS before, the ninth bit was not connected, these 2 inputs must be connected
to 0 volts or +5 volts...

If these pins are not connected your SIMM could draw to much current and get
hot, this is caused by the CMOS devices both comming on, they are no longer
working as a digital device but in analog linear mode......

On all CMOS devices all unused inputs must be connected to 0v or +v...

Chris Herborth wrote in article <H.eg.Sqp7NQYG8M6@semprini.waterloo-rdp.on.ca> :
>For example, the standard GIF, PostScript, or JPEG inline tag is:

Current WWW servers do not have PostScript or JPEG inline tags. That is the
first difference between a WWW served document and the HTML specification!
>
><img src="http://foo.bar.com/bozo.gif" align="top">

To quote from the HTML documentation presented by the NCSA:

"Inline Images

NCSA Mosaic is can display X Bitmap (XBM) or GIF format images inside
documents. Each image takes time to process and slows down the initial
display of the document. Using a particular image multiple times in a
document causes very little performance degradation compared to using
the image only once.

NOTE: The <img> tag is an HTML extension first implemented in NCSA Mosaic.
Currently it is not understood by most other World Wide Web browsers."

What you appear to be talking about are external images, which the HTML
documentation for which NCSA Mosaic says:

"External Images

You may want to have an image open as a separate document when a user
activates a link on either a word or a smaller version of the image that
you have inlined into your document. This is considered an external image
and is particularly useful because (assuming you use a word for your
hypertext link) you do not have any processing time degradation in the
main document. Even if you include a small image in your document as
the hyperlink to the larger image, the processing time for the ``postage
stamp'' image is less than the full image.

To include a reference to a graphic in an external document, use

<A HREF = "filename.gif">link anchor</A>

Make certain the image is in GIF, TIFF, JPEG, RGB, or HDF format."

The difference between in-line GIF (or XBM) images and external images is
that a separate viewer is called up for the external image. All in-line
images you may have seen coming from a WWW server are GIF (or XBM) files.
These may be 'thumbnail' images which, when selected, will bring in the fully

detailed JPEG/TIFF/whatever.

>So, we use:
>
><atari-img src="http://localhost/c/www/images/bozo.img" align="top">
>
>for IMG and GEM and whatever else. I seriously doubt that the HTML
>specs limit you to using just GIF, JPEG, PS, etc... you'll just get
>that Mosaic icon when it hits an image it can't interpret.

Actually, you'll get nothing. (I tried out your line in an HTML document, looked at it using Mosaic, and nothing shows up.)

However -- if you reference a non-GIF/non-XBM image using the standard in-line (img src= ...> statement, you DO get the NCSA icon. (I tried this out using a JPEG image ...)

So, keep working on your HTML document viewer, but don't add any 'new' things like <atari-img ...> when the original will do.

I'll e-mail you the NCSA "Recommended Document Format Specifications..

- David Paschall-Zimbel

2223. PAK3

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-29 17:12:04 UTC
From: sk@lumumba.sh.sub.de
Message-ID: <H.eg.ZVPQ_2FlqMA@lumumba.sh.sub.de>
Source record: 33068

Recently there were some rumours about the PAK3-accelerator-board in
this group and I decided to give you more information on this subject.
Here it is:

Some information about the PAK3
==============================

First : It's hard work for me to do this in English and I hope you
appreciate it.

0. Disclaimer

I've nothing to do with c't magazine nor with any other
PAK-related companies.

1. General

The PAK3 is, as the name says, the third generation of an accelerator
board for MC68000 based computers. Its design has fully been published
by the German computer magazine c't, including the schematics and GAL
equations (issues 11/93, 12/93 and 2/94).

The board has been designed to emulate the MC68000 processors bus
interface at best, so it is not Atari specific but can used in Amigas
and Macs as well.

2. Now to the technical stuff...

There are two versions of the PAK3: One for an MC68020 processor, its
full name is PAK-68/3-020, and one for an MC68030 processor called
PAK-68/3-030.

Technically, both versions are the same, but have different PCB-layouts
with regard to the different pin layouts of both processors.
There are some advantages of the -030 version, though. You can use
the PMMU capabilities of this processor for memory protection and
virtual memory purposes. There is also a fast-ram (alternate ram)
option planned for this version. But if you 're only interested in speed
you'd better take the -020 board, because the MC68020 is much cheaper than
a -030. The -030 board has only a slight advantage in speed of
about 15% max.

3. More technical stuff...

the whole bus interface and all other logic (except two '541 drivers)
consist of five GALs, so every change in design can be made with new
GAL equations.

The 32 Kbyte second-level-cache (1st is in CPU) is made of four
CY7C185-25 cache-rams and two MK48S74-25 tag-rams (it's hard to get them!).
This cache is optionally, the same with a 68881/2-FPU.

There are also four sockets on board for OS-EPROMs, so that the CPU
has full 32bit access to the operating system.

Additionally there are some capacitors, resistors an oszillator and
a 74F86 for 8 to 16 MHz clock doubling.

You can use the PAK3 in two modes, the synchronous mode (16 MHz),
driven by the clock doubled 8 MHz from the mainboard, or the
asynchronous mode (32 MHz) driven by an oscillator on the PAK.
In my opinion there's no reason to use the PAK in the first mode,
except you have an overcritical designed mainboard (like the Amiga).
Note, that there are different GAL-sets for each configuration
(type of computer, CPU, mode)!

In most cases an Atari will also run with 36 MHz CPU-clock (asynchr.) on
the PAK, sometimes it will even run at 40 MHz, just change the oscillator
to try this out.

'Unfortunately', my PAK3 runs 'only' at 36 MHz in my Mega ST. 40 MHz runs
well after a warm-up time of about 15 minutes but it bombs in cold state.
It seems not to be a big problem so maybe I can fix this sometime.
There are a lot of 40 MHz PAKs around, running without problems.

4. Mechanics

To install the PAK you have to remove the old MC68000-CPU and solder
a 64pin socket in, where you can plug in the PAK. There's
also an option to install the old CPU onto the PAK with an additional
GAL. The PAK has the dimensions 152x89 mm and fits best in Mega STs.
It's difficult with the smaller ST's and you better build them into
a PC-Tower. Adapters for ST's with PLCC-CPUs are available.
The Blitter has to be removed or switched off, the new
processor is faster anyhow.
It's (always) recommended to replace the 74LS244 and 74LS373 drivers/
latches on the Atari-mainboard by faster 'F' types.

5. Software

You can run the PAK with Atari's universal TOS 2.06, which needs not to
be modified. Older TOSses cannot handle with CPUs > 68000.
But if you want to use the PMMU capabilities of the PAK3-030 you 'll
need a (patched) TOS 3.06 which supports the PMMU. There are also
difficulties with some harddisk-drivers on a PAK3-030 with TOS 2.06
because of uninitialized PMMU-tables, but AHDI works fine.

All well programmed newer Software will run on the PAK without
problems. Some games and software with loops for time-delays or
dirty tricks like self modifying code will have problems.

6. Costs

The PAK is thought as a do-it-yourself project. The PCB costs
about 100 DM, each GAL costs 10 DM if you don't burn it yourself.
Further costs will depend on your configuration (CPU-Type, with or
without Cache or FPU). There are some companies here in Germany
which sell also ready-to-use PAKs and parts-sets mostly with
cheap used processors. Parts-sets are about 550 DM and assembled
PAKs about 700 DM (both w/Cache and used CPU, w/o FPU and TOS).
Maybe you have cheaper sources of the chips, especially the CPUs,
in overseas.

7. Advice

This is absolutely NO project fo beginners! It's a 4-layer
PCB with approx. 800 pinholes.
You should only do it on your own if you would fly in a
plane you 've soldered yourself.

8. Benchmarks

I've chosen the fastest TT-mode as reference, because the TT
is the real competitor for an PAK-ST:

```
GEM Bench v3.40 ï¿½ Ofir Gal 14.1.94
================================================
ST TOS 2.06, MiNT not present
Blitter not present, NVDI not present
Video Mode = 640 * 400 * 2 Colours
LineF FPU installed
Run and Malloc from STRAM
Ref = TT + Fast RAM + FPU, ST High
PAK-68/3-030, no ACCs!, no AUTO-PRGs!
================================================

CPU-clock 32 MHz 36 MHz 40 MHz
================================================
GEM Dialog Box: 123% 133% 140%
VDI Text: 130% 140% 146%
VDI Text Effects: 127% 138% 146%
VDI Small Text: 138% 148% 156%
VDI Graphics: 120% 130% 137%
GEM Window: 115% 122% 127%
Integer Division: 99% 112% 124%
Float Math: 81% 87% 92%
RAM Access: 171% 192% 214%
ROM Access: 149% 168% 186%
Blitting: 84% 90% 98%
VDI Scroll: 105% 110% 114%
Justified Text: 125% 134% 140%
VDI Enquire: 109% 118% 123%
New Dialogs: 114% 122% 128%
================================================
Graphics: 117% 125% 132%
CPU: 125% 139% 154%
```

Average: 119% 129% 138%

my own benchmark : 494% 524% 570% (rel. 8 MHz ST!)
LKURZ (all three runs): 7'59" 7'40" 7'25"

My own benchmark is more calculation-based (sieve, sort, matrix inversion...)
in contrast to the GEM-graphics tests of GEMBench, but _without_ FPU-code.
You will gain some more performance of OS-routines if you use TOS 3.06,
because of some -020-code in it.
LKURZ is a typically speed test for TeX, sorry for having no 8 MHz values
but it's about 5 to 6 times slowlier.

9. Epilog

I 've done this summary because I think the PAK is the best thing you
can do for your Atari. Compared to the old 8 MHz machines, a PAK-ST is
really unbelievable fast. Even if you have to do fast calculations
there's no more need to buy a clumsy clone and dump your easy-to-use
Atari together with lots of well designed software. The PAK also runs
very stable and uncritical in comparison to other accelerator boards.
Most (all?) developers are on the net.

Greetings,
Stefan

> Is the Falcon true CD quality ????

With the inbuild AD/DA converters? No, not completely. The frequency
response is very good, but the signal/noise ratio is not, due to some
noise and other distortions. But compared to other computers (PC/Mac)
it's superior. Only EXPENSIVE add-on cards sound better.

Hello,

I'm looking for a cheep 2 chip set of Tos 1.4 (anyone upgraded to
2.06 and have a spare set arround?)

Thanks,

Dave.

That is the german number, transfered to holland at cost of Atari. I
guess they prefer users outside Germany to contact the dutch numbers
directly in order to safe costs.

They are:

+31 3473 77272 Telephone and +31 +31 3473 77200 FAX.

I _think_ (still haven't looked into it much) that MiNT-net can be used
now; I'm looking for a local site to connect to via SLIP now so I can
test this with LYNX.

I might try porting httpd, too; then I can serve myself and whoever I'm
connected to via SLIP. (As an aside, I set a Gopher server up on my
OS/2 box at work as a WWW server; very K00L. Performance is good, even
on such a wimpy box, too.)

If anyone is interested, I wrote a tiny AUTO program that turns off the keyclick (handy, since I often boot MiNT and a shell straight out of AUTO); I lost the C source many years ago in a disk crash though.

I've got a Mega STE 4 with a Maxstor 7120S (The 120Mb) Drive inside. I've had no problems with it. However due to the timing of the purchase, just when Mega STE's were hard to get hold of, It got the French TV modulator in. I wouldn't bring this up except that serval people have told me that up can't have a 1.44Mb drive or a large Hard Drive internally if you have the UK TV modulator. At first I took this to be bull, and in the most part it is. But if I try and install my HD in either of my friends (I mean the friends that have MSTE's, not that I only have 2 friends!!!) machines, which are UK born and bred, it won't work.

Also has anyone succeed in finding a way to rework the MSTE's cart port to be backward compatable? I know the layout in the book says it is, but isn't as none of my cart devices work on anyones MSTE or Falcon.

I feel so embarassed having to ask this question. But none of my reference books tell me:

When wiring for a potentiometer, the pot should be connected to the pot pin, with the other lead going to _____ ? Is it Gnd or +5V ???

Please reply here. Thanks for any help.

2232. 520ST replacement drives, and the FMC patch

Newsgroup: comp.sys.atari.st.tech
Date: 1994-04-30 19:40:36 UTC
From: irf1001@cus.cam.ac.uk
Message-ID: <2puc7k$mnh@lyra.csx.cam.ac.uk>
Source record: 33063

There was a problem with some double-sided floppy drive upgrades that were being supplied a while back, and yes, I've got one of them. The problem is that the ST does not notice a disk-swap unless the new disk is write-protected. If you insert a new disk and try to write to it straight away, with write-protection off, the ST assumes you're still using the previous one; it uses cached directory information and corrupts the disk.

There is a PD patch for this, namely FMC (force media change), which attempts to override the cache process and assume a disk change every time. It works quite well in my experience, but fails if you alternate between single and double-sided disks.

Does anyone know what is physically wrong in the connections to these drives? I've lost enough data because of the fault that I'm on the verge of junking the drive altogether and buying a new one...

Your potentiometer should have THREE connectors. Connect the outside two to Gnd and +5V respectively. Connect the middle one to the signal input (pot pin?)

Yes and no: MintNet alone won't work because of the not-yet-finished TCP
part. But if you can dial in to a UNIX machine you can run Lynx over term,
the serial-line multiplexer. This requires the term patches for lynx.
I have put a patch to turn lynx2-3 of April 25 from stat1.cc.ukans.edu
into a Lynx-for-atari+term on ftp.twi.tudelft.nl. There's also a binary
there. Of course you can always run it on local files...

Laser C (formerly Megamax C) was a normal compiler, like Pure C or
Lattice C; it also had a similar crappy IDE.

I used to use Laser C from the command line... then I got Sozobon C and
Ian's Heat & Serve C... then I got GNU C and started learning C++...

Date: 1994-05-01 20:12:00 UTC
From: Stefan_Damerau@sl.maus.de
Message-ID: <199405012212.a626@sl.maus.de>
Source record: 32945

In article jchappel@charon.engga.uwo.ca (Jerry L. Chappell) writes:

JLC>When wiring for a potentiometer, the pot should be connected to the
JLC>pot pin, with the other lead going to _____ ? Is it Gnd or +5V ???

Depends on what you want to do with it.

To get a simple variable resistor do so:

```
A a _______ B
-----------|_______|--+----
^ |
b|_______|
```

If you do so you'll get different values of the resistor between A and B

You must imagine this wiring the follwing way:

```
A _______ c B
------------+-|_______|----+---
| |
| ______ d |
--|______|------
```

c: The resist from the two outer connections of the potentiometer.
d: The resist from a to b

If you connect as described above the connection is:

A (-> a -> b) -> d -> B

If it's a 500ohm potentiometer the value will be from 0ohms to 500ohms.

Bye
Stefan

Source record: 33070

A friend of mine gave me an old 1200 Baud Apple II modem.
I am trying to figure out how to connect a cable btween the
modem and the ST. According to the Apple manual, the modem
conforms to the RS-232 Standard. As we all know, the ST is missing
the Data Set Ready line. What do you think I should do?
I tried kludging a 8 pin Mini to DB25 connector with no luck.
I went from each signal to it's corresponding signal on the
ST. (With the exception of DSR) Should that have worked?

THanks,

Hi friends

Suppose the subject above says it all.

What I would specifically like to know, is how to write a High Density Disk Drive cookie. I would like to write a program that would bring up the extra format option for HD drives under the formart menu in tos 2.06. Hopefully, this will be in C.

If I can not be helped with this, then a simple explanation of how to write a cookie will suffice.

Am I right in thinking that this can only be done with TSRs? And that this address (for the cookie jar) is at 5A0?

Thanx in advance. I hope to hear from you guys soon.

Rename MINT.PRG to MINTNP.PRG and it should work. (Switches MemoryProtection
off)

K>BTW, has anyone a PAK/3 running in a MegaSTe?

It's possible, but it won't fit into the original housing because it would
conflict with the power supply. And you need an adaptor from PLCC 2 DIL, to
make it work in a MegaSTE.

Lots of Atari users with non-english/american language gets into lots of trouble when english speaking programmers forget about the rest of the world!

We experience over and over again programs that won't even allow us to type in the special characters of our languages, such as the norwegian (A with an o above), the Ø (O with /) and Æ (combined AE).

Why? Du you programmers restrict text input to ASCII 31-127?

I've only written one piece of software myself, The Spitting Fish from Budgie UK.

In this program I worked out a solution to make it easy to translate the program to any language. How? Simply by putting all the programtext in a separate file, just like a random access datafile. The program just had to give the line number to find the text when needed.

I, and other members of our usergroup will be more than glad to help translating your software to norwegian - to make it more attracktive to norwegian PD/shareware users.

The usergroup can also distribute the software - and if that's what you want -do the shareware registration for you, f.ex. by credit cards. We can also du registration for the other scandinavian countries!

So all you programmers out there - please bear in mind: There are Atari users out there with more than 27 characters in the alphabet!

This I recommend as well. It _is_ very good. As all other Motorola manuals I know.

>My copy (third edition, printed 2/91) cost me less than $20 Australian.
Several years ago, I had difficulties in buying it since Motorola distributors (at least in Germany) only wanted to sell it to registered developers which I am not. For the same reason I didn't succeed in buying a MC68040 manual.
Now, my question is whether these manuals can be bought in a normal bookstore?

Bye,
Alex.

|> I advise users to set up the INF file with an older CONTROL.ACC or edit by
|> hand (6th digit from the right on the #c line 1 = on, 0 = off).

But that won't help you either if CONTROL.ACC isn't loaded! The first four lines in DESKTOP/NEWDESK.INF are not used in any way by the desktop. They are just a placeholder where the old CONTROL.ACC saved its state.

Btw, if you change DESKTOP/NEWDESK.INF, make sure that there are exactly 128 bytes (including CRLF) in the first four lines, otherwise the next time you save your desktop the file will be garbled.

Unfortunately you can't buy those books in a bookstore. You can only get them directly from Motorola or from an authorized dealer. Here (in Switzerland) I can get them from a dealer, but perhaps they are a bit more expensive than in Germany. If you really can't get them, we could make a deal? As I owe all these manuals and I don't really need them anymore, I could even sell my own ones, if new ones are too expensive for you.

Emanuel,

there are several Motorola books that can be ordered from Prentice Hall.
If you are looking for a good book about the MC68030, then try this one:

MC68030 Enhanced 32-bit Microprocessor User's Manual
Third Edition

Motorola Document code: MC68030UM/AD REV 2
ISBN 0-13-566423-3

Prentice Hall, Englewood Cliffs, NJ 07632, USA

This book might even be more useful for a programmer:

M68000,MC68020,MC68030,MC68040,MC68851,MC68881,MC68882
Programmer's Reference Manual
Includes CPU 32 Instructions

Motorola Document code: M68000PM/AD

Available from: Motorola Ltd., European Literature Centre
88 Tanners Drive, Blakelands, Milton Keynes
MK14 5BP, England

Ralf.

2259. CD-ROM FAQ Calling

Newsgroup: comp.sys.atari.st.tech

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

There have been a lot of questions and answers about CD-ROM on ATARI
Computers .
I think it's time for a "Frequently Asked Question" about it.
I make it if you send me your experience on CD-ROM for ATARI computers.

So if you installed one, send me :

- Your configuration;
- the model of CD-ROM drive you have;
- the drivers you tried (the working and the non working ones);
- the discs you tried;
- your needs or desires;
- everything that can be usefull.

I would also like to have a chapter about the programmation of the cd-rom
(How do we access SCSI bus on falcon & TT, where do we find usefull
documents about it, ...)

Thanks a lot .
Loic

P.S. : Please excuse my english.

This is because XControlPanel made a retrograde set in that it didn't write
these things to the DESKTOP/NEWDESK.INF file like CONTROL.ACC did.

Load your INF in an editor and on the #c line change the 6th digit from the
right end to a 0. Save and it should always boot up with keyclick off.

I don't know if it's the same thing, but I got a 680x0 manual (0,1,2,3,4)
and CPU32 for around $4... this was for my assembly language class few semesters
back... it's from motorola and it has a quick reference card... it's pretty
good... I use it a lot when I do assembly language programming...

Also there is a good book by Ford and Topp on the same subject...
"68000 assembly language and systems programming"... it has a lot of souce,
even for a multitasking kernel... periferal programming, etc... that was
around $50...

anyway, if anyone needs that manual, I'm sure I could get it for you...

Does any one have a keyboard for the Atari 520 ST on which all keys work.

Is it possible to get such a replacement part directly from Atari Corp?

Also as there was a message here about contacting TOAD for their full Atari catalog do they perhaps sell a replacement keyboard? When I called they said it would be about six weeks before the new catalog was shipped. Another firm BRE Software had to be called about four times over the course of a year before they sent one of their catalogs for pd software, then after one order I missplaced it.

2266. ATW-800 for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-03 08:03:12 UTC
From: dt93tn@pt.hk-r.se
Message-ID: <1994May3.080312.28478@nomina.lu.se>
Source record: 32950

I have two Atari Transputer Workstation computer and one
Quad transputer Farmcard for sale.

The Workstation consists of two computers in one.
The Server is an modified Atari Mega ST computer that is taking
care of the mouse/keyboard/harddisk/diskdrive. Both parts has its
own graphics system and display. The Client is consists of at least
one T800 transputer communication via 20Mbit links.

Here's some technical specifications:

Processors:
main:
32-bitars INMOS T800-G20 20Mhz with built in FPU
Graphics:
RasterOp processor designed for X-Windows
64Mbyte/sec area fill
Hardware line draw fill
Support for patternmatching and sorting of data

I/O: (Server) Atari Mega ST 8Mhz Motorola 68000
Communicates with the T800 via a 20Mbit/s link.

Memory:
Main: 4Mbytes Dram for Transputer
Video: 1Mbytes dualported for Transputer & Graphics
I/O: 1Mbyte Dram for Atari

Video:
Mode: Resolution: Bitplanes Palette
0 1280*960 4 4096
1 1024*768 8 16.7Million
2 640*480 8 16.7Million
3 512*480 32 16.7Million

I/O ports :
Keyboard, mouse, SCSI, printer, RS-232, Midi, ACSI(DMA),
4 buffered transputer links (ECL and TTL), RGB video output.

Disc Storage:
1 40 Mbytes Harddisk
1 720 Kbytes diskdrive

Expansion:
Room for 12 extra T800's, crossbar switch, memory expansion,
ethernet....
Plenty of room for more harddisk and discdrives....

Operating System:

Helios (UNIX) multitasking, distributed operating system.

User Interface:

X-windows

All this is built into an metallic Towercase.

Please let me know if you are interested or you want some
more information. Please give me an offer for this amazing
computersystem.

I also have an Transputer Farmcard forsale.

The farmcard consists of 4 T800-20Mhz transputers and each
transputer has its own 1Mbyte memory.

The Technical specifications of the card is:

4 T-800 tranputers 20Mhz
4 Mbyte`s of ram, 1Mbyte per Transputer.
Reset, Analyse and Activity LEDs.
Can be used with ca C004 crossbar switch

Please give me an offer for this Farmcard.

Hi,

I am planning to write a harddisk recording program for the Replay 16
cartridge.
For this I will certainly need harddisk DMA writing.
Does somebody have an example on how to use DMA in C or assembler?

I have a MegaSTE, but I think DMA works the same on it as on a ST.

To show my gratitude, I will put this program in the PD.

Richard.

: [...]

: The last information i have is that MiNT will *not*
: run on a PAK. The developers claim it is a bug in MiNT,
: which may be right.

: Has this changed or is it still a non-MiNT System?

Where can I get these drwings and docs to produce the card? I know that this was in a german mag, but can anyone out there send me the stuff?

This does not have to be the magazines, scanned pages will do. I'd like to have a go. Here in England, I am still waiting for the T28 for the STe, and there is still no sign of it arriving.

BTW, is the PAK3 for the STe as well? I've got a STe, upgraded to TOS 2.06.

And is it now compat with MiNT, MINIX, Mag!X, Geneva????

Questions, questions, questions....

Thanx in advance.

Danny.

I suppose that you will need to connect it to your DMA port via a SCSI
adaptor, such as ICD's LINK.

Or if you have an internal SCSI adaptor, then connect it directly to
this, via the SCSI out port.

Hope this helps.

Danny.

BACH@EZINFO.VMSMAIL.ETHZ.CH (CHRISTEN,BEAT ALBERT) writes:

>I am looking for the file format of the MIDI program Notator.
>Is it freely available?

There was a prorgam you could buy a while ago which would load in a .SON and
display all the relevant song data (apart from the notes themselves). From
this you could extract a lot of the file format.
Other than that and working it out yourself there's not much you can do -
big software companies rarely give out format details and treat them like a
well kept secret.

>Besides this i'd like to have a description for the general midi file format.

I'm sure there must be a file detailing this at one of the main music FTP
sites, but I'm not sure. It certainly should be freely available as plenty of
PD programs have midifile capability.

I've got to demonstate my project soon so.....

Can I just stick my microphone in the back of my Falcon and then it will record sound.

At the moment I've got it routed into my stereo (mic input) out the headphone and then into the Falcon.

My microphone is not battery operated and has an on/off switch built in.

Nice One,
Phil.

|>

My Mega STe (2Mb, internal 105Mb Quatum LPS) has a non-UK modulator in it as well (lucky I've got a SCART TV now really - having mono only was getting me down !) and "heard" that there weren't any Mega STes produced with UK modulators - now I guess this could be bull as well (especially as it came from the guy I bought it off ...) but if the UK modulators aren't factory fitted, might this be the cause of disk drive problems ? Ok - it's a bit unlikely but ...

|> Also has anyone succeed in finding a way to rework the MSTE's cart port to
|> be backward compatable? I know the layout in the book says it is, but isn't

|>

Any cartridges in particular ? My clock and Stereo Replay work fine in the Mega, I known there are problems with the Falcon that only show up on some carts not all - something to do with an "undocumented design change" which I did hear Atari have denied doing !! Ho hum - nothing new there then ...

Later,

Martin

Atari Works' solution to the language problem is using two sets of resource files. One in German and the other in English. (for the one I have) One resource file has all the strings that Works displays anywhere all in english. The other has all of the same strings in German. If you are writing GEM programs, then this is a good solution.

The thing about accents is that English used to have them, but has lost them. We used to have circumflex, grave, acute, and umlaut. We also used to have the letter ash (the combined ae thing), but that has since gone away. We even had a runic letter for the interdental fricative now spelled as 'th'. As a result, to a foreigner, the english vowel system has become exceedingly ambiguous. You have to rely partly on the arrangements of surrounding consonants, and various combination of vowel letters that end up being pronounced as one vowel, while I is actually a dipthong, and U is often jat prefixed. The 'great vowel shift' made english vowels different from the continental pronounciations, and it also made long vowels qualitatively different from short vowels. Due to its latin and germanic heritage, english used to have a much larger vowel system than it used to, but it's still quite large, especially when compared to languages like Hebrew and Arabic. And speeking of Hebrew and Arabic, while they have in the past 2000 years added symbols to their writing systems that represent vowels, they did not originally, and still do not use them in every-day writing. How do you know what the vowel is? You memorize it. And to a lesser extent, you have to in english since the spelling does not always directly represent the pronounciation.

Accents on paper are easy... you make a mark. Accents on a computer are a major pain in the neck. Either you have special arrangements in your word processor, or you add a bunch of extra symbols to your extended character set that represent all the possible combinations of vowels and accent symbols. Try reading and writing your indo-european language without accents. You'll know what's there... you'll use the spelling, and the context to determine what the word is if there is any ambiguity, and you'll recognize exactly where the missing accents should go. A friend of mine talks on the IRC in French all the time, totally without accents, and it works just fine. You can do it with German too, and if necessary, add letters to help (like an e after a letter with an umlaut, or ss for es-zet). You'd handle it about as well as something written with a bunch of spelling errors... you'd know what was said.

I'm not saying that your arguement for accents and the like is invalid. I'm just giving the linguistic reasons for why I MIGHT not bother, at least not for an early version of a program. The same reasons would apply to why I wouldn't bother making a word processor capable of handling right-to-left writing systems like Hebrew or Arabic; it just wouldn't be worth it initially,

despite the fact that I really like Hebrew.

If you like, you can detail for me the excentricities of your spelling system, and I could come up with some alternative spellings that don't use accents. :) Actually, you know the language, so you should do that if you like, but there are going to be MANY times (like now) when you can't use your special characters and accents. In your message, the ash came out OK, but the o with an accent did not, because I'm using an IBM PC's extended character set. I'm surprised the Internet didn't cut off that high bit and give me something in the 0-127 range.

Check out my 'libscsi' library on a.a.u.e in the Utilities directory.
You will find low-level DMA code in assembler, and C wrapper routines
to make life easier. (Works with the ACSI DMA port only, BTW [ST/STE])

Cheers, Steve

>Computers .
>I think it's time for a "Frequently Asked Question" about it.

I've written an entry for the CDROM FAQ on ftp.cdrom.com, unfortunately,
there hasn't been a new release since mid of March. Here's what I wrote:

Do you have any info about the CD-ROM filesystems for Ataris?

MetaDOS
free software from Atari Corp.
available from atari.archive.umich.edu or ftp.muenster.de (metads23.zip)

The filesystem drivers support ISO9660 and High Sierra CDs, but not
multisession CDs. The device driver only works for the Atari CDAR504
connected to the ACSI bus or with generic SCSI CD-ROMs connected to the
TT SCSI port.

CD-Tool
commercial solution from Hard & Soft, Obere Muensterstrasse 33--35,
D-44575 Castrop-Rauxel, Germany, phone: ++49 2305 18014, fax: ++49 2305
32463)

Includes MetaDOS with GEM-based installation program, audio player with
PCM audio data import (only some drives) and custom device and
filesystem drivers (support for Atari CDAR 504 and generic SCSI CD-ROMs
connected to ACSI through host adapter, TT-SCSI or Falcon-SCSI,
multisession support (only some drives)).

>[...]
>I would also like to have a chapter about the programmation of the cd-rom
>(How do we access SCSI bus on falcon & TT, where do we find usefull
>documents about it, ...)

You should always use the drivers to access CD ROM drives. I'll upload
bindings shortly.

> - everything that can be usefull.

>I would also like to have a chapter about the programmation of the cd-rom
>(How do we access SCSI bus on falcon & TT, where do we find usefull
>documents about it, ...)

Yep, I've connected a CD-ROM to my TT (drive runs also on a Falcon)

My configuration:

Computer: TT030 4 Mb ST Ram, 4 Mb TT Ram, 210 Mb HD

OS: Mint (1.04) + MultiTOS

CD-ROM drive: NEC 210 (also known as NEC55j?)
(double speed SCSI internal drive)

Current driver: CD-Tools 1.08 from Hard&Soft Computerzubehor GmbH

DOS discs tried:
- The Best of Demo (Comptec Multimedia)
contains lots of GIF/BMP/MOD/TXT files
- Monster Media issue 2 1993 (by Monster Media?)
contains also lot's of GIF/BMP/MOD/TXT files
- TOP 101 shareware programs (came along with the drive)
hardly usable, only DOS stuff.
- Music Box 1994 (Powersource inc)
tons of MOD and VOC (about same as WAV) sound files.
Atari discs tried:
- DTP Grafiken (by Werbedesign Schutz)
contains tons of clipart files in IMG and (DOS) PCX
format, disc was made for Atari and DOS

Needs:
- Real Atari discs !!!! (OK Gemini exists but I haven't
got it yet...)
- SCSI drivers that USE DMA !!! CD-ROM (and Harddisc)
access take up much too much time under MultiTOS.
- An audio disc player program for this CD-ROM drive...

Other drivers I've tried are several earlier releases of Metados from
Atari, a modified Metados for the Falcon and some XFS drivers for
Mint/MultiTOS (ICD and Atari).

Most of them work OK but for some discs (for example the DTP Grafiken disc)
the older drivers cannot cope with the large amount of files in a
subdirectory (with DTP Grafiken there are folders with over 700 files!)
Clicking on the folder icon just doesn't open the folder...
The driver from Hard&Soft seems to work for all of my current CD-ROM discs.

The XFS driver for Mint/MultiTOS is slow... The Metados drivers seem to
buffer much more data, problem with Metados is that it's supposed NOT to
work with Mint/MultiTOS. However, I haven't got any problems yet.

For the TT there is a German book called Profibuch for the Atari
ST/(mega)STE and TT. It contains all the hardware addresses and a complete
overview of all the XBIOS/BIOS/VDI etc calls. Hardware connections are also
supplied including tips on how to connect an extra floppy drive etc.
I don't know if there is an English written version of it and if there is a
Falcon update. But as far as I know the SCSI port of the Falcon and the TT
are roughly the same (except for the external connector :-(

Well, hope I have supplied enough information...

Greetings,
Gert

Use GEMDOS. It will be fast enough, especially for large files (there is
practically zero overhead in a Fwrite of a few hundred 100 KBytes).

It seems you tried compiling zoo for MiNT so it will work properly with
the Minix-Filesystem. Remember Minix is an Operating System!

If you have problems with Include-Files, just try to comment out the
#include statement and see what the compiler tells you about undefined
stuff. Then do a grep over /usr/include/* and /usr/include/sys/* and
see where the stuff is defined. Sometimes it helps, sometimes not.

If you are looking for a zoo-Binary which works fine on a Minix-filesystem
and is shareable under MiNT ask archie for 'bmintzoo'.

Bye,
Knarf

Atari Linux Info Sheet
Author: Robert de Vries (robert@koekamp.and.nl)
Coordinator Atari-Linux development group on the Internet
Version: 1.1
Date: Apr 29 1994

Current Status

We have a booting kernel for the TT. The startup code in m68k/head.S
does not yet work on a Falcon. It gets halfway.
The following device drivers have been developed.
* serial drivers for debugging
* console driver (TT/Falcon), not yet integrated
* keyboard/mouse/joystick driver
* scsi driver (no DMA)

The work is based on the Amiga linux kernel as maintained by Hamish
Mcdonald (hamish@bnr.ca).
There is a set of patches against the latest amiga kernel (0.08pl2).

Other group on MausNet

There is also another group in Germany doing a parallel development
effort. They are on MausNet. We will merge our versions as soon as
possible. Our version or the MausNet version, or the merged version
will be patched into the Amiga-Linux kernel as soon as possible. (This
really depends on Hamish Mcdonald. I can't speak for him, I'm merely
expressing hopes :-).

Development

At this moment there is a working cross-development environment on a
80x86 linux computer. I have a set of patches against the development
tools on tsx-11.mit.edu.
The development tools are available by ftp from tsx-11.mit.edu in the
directory /pub/linux/680x0/tools. Grab binutils-1.9l.1.tar.gz and
gas-2.2.linux.tar.gz. Next you will need a recent version of the gcc
sources. (>=2.5.7)
Sources of the amiga linux kernel are also available by ftp from
tsx-11.mit.edu in the directory /pub/linux/680x0/src. Grab
linux-0.08pl2.tar.gz.

If you're interested in some development, mail me. I will send you the
next set of patches directly. When I am sure that they will produce a
working kernel on at least the TT, they will be sent to Hamish for
inclusion in the mainstraim linux-680x0 kernel sources.

Robert

Nope, the Falcon030's Blitter is 16-bit.

Yes, it should work fine, but you may have to turn up the input gain.

That's how it's supposed to work (surprisingly enough). Assuming you have
the necessary software...

> At the moment I've got it routed into my stereo (mic input) out the headphone
> and then into the Falcon.

Then the level is almost certainly way too high. To use the Falcon input
to record line- or headphone-level signals you need to put a resistor in
series with each channel.

I've even recorded from the speaker tags of a Fender valve amp that way :).
(Children: do *not* try to do this at home...)

2297. MiNT login. Problems & Fixes.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-04 13:41:59 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <CpA621.91y@newcastle.ac.uk>
Source record: 32978

I've been playing with the mintosbn system log & access control package for MiNT
and I've come across a few problems.

PROBLEM 1
==========

Firstly, once init has started all the daemons (portmap, line printer, inetd, etc)
it runs /etc/getty to let you log in on the console.

This is great, but getty then displays a garbage prompt. The prompt sorts itself
out if you type the login wrong (I assume that this is because the second
login prompt is from login.ttp not getty).

You can still log in however, so it just looks a bit untidy.

FIX FOR RUNNING MULTITOS <> ROOT
================================

I've sorted out the problem of having multiTOS run after you have logged in
though. All users who will want to use multiTOS must be members of the group
0 (wheel) - this can be set up in the passwords file. You can then put
a link to gem.sys from /bin

```
cd /bin;
ln -s /c/multitos/gem.sys gem.prg;
ln -s /c/multitos/gem.cnf gem.cnf;
```

Now, typing gem at the console shell will run multitos - as the user who logged
in, with all access restrictions in place.
It is esp. nessecary to do it this way if you use NVDI as well as MultiTOS, as
if the user is not a member of group 0 then NVDI cann't access the NVDIDRV*.SYS
files and crashes.

PROBLEM 2
==========

I can't persuade wlogin to work - it crashes well bad when I run it.
My TOS window manager is Warwick Allison's version of TOSWIN, with RUNTOS
installed as the runner.

Any offers?

2301. Problems with GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-04 16:04:23 UTC
From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <whlwS7i00WB6M6KepJ@andrew.cmu.edu>
Source record: 32981

Well, since nobody seems to be able to help me with my question about ZOO for Minix, I'll go onto another problem. Somewhere along the line I messed up my GCC config. Things were working a while ago, but once I tried to start getting newer versions of the files, I've been having problems. I'm currently running gcc under MiNT on a Minix partition. I think I have patch level 44 of the libraries and include files, Gas version 1.38p4, and Gcc version 2.53. When I try to compile Compress, I get the following errors:

```
# make -f makefile.minix compress
gcc -DMINIX -DUNIX -DNDEBUG -traditional -U__GNUC__ -O -mint -c
compress.c -o compress.o
In file included from compress.c:100:

2302. need advice replacing 1040stf drive A

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-04 16:45:13 UTC
From: nicole@seas.smu.edu
Message-ID: <1994May4.164513.24356@seas.smu.edu>
Source record: 32984

I'm currently running my 1040stf with one of my old 520's sf354 ss drives as drive A because my built-in drive went blooey. I just plugged in the 34-pin connector (minus a key that didn't have a matching notch in the circuit-board) and the 4-wire power connector. Wordwriter works ok, but Flash gives persisten "Invalid Drive" messages.

Of course, I'd like to get back to double-sided on A, especially since I don't have a hard drive or external double-sided drive. To that end, I picked up ibmdriv.lzh from atari archive and also diskdriv.arc, which has the same "Generic 3.5..." by James Lacassagne along with some other text as well. But my specific replacement isn't described.

I didn't think that would be a problem, since the ss drive worked so easily, until I plugged in a Sony MP-F53W-00D (or that might be OOD) and got spin without read, write, or step.

Is the MP-F53W-00D likely at fault?

Have I missed a jumper (I tried with and without jumper from pin 2 to pin 28 per lacassagne's article)?

There's a tiny four-position slide switch on the right rear bottom which I've tried all four ways each with and without jumber 2 to 28. One of these gives me something that sounds like stepping. I thought it might be the drive number select mentioned in another article by Rod Smith.

I'll be carefully re-reading the archived material for any other clues, but meanwhile, I thought I'd let loose a plea for help.

Anyone done the same switcheroo successfully?

Anyone know where to find the Sony dd pinouts described? (I've never tried the clone usenet groups, so I don't know if they're as helpful as ST people. In person, when I mention my beloved st, they always give me the "And you eat cockroaches and drink dirty dishwater" look.

Anyone want a TDK-T41V with slightly jabberwocky 2nd head and possible maladjusted stepping motor and other possible ailment(s)?

One final note. I am a poor writer and artist and cannot afford suggestions that involve spending money such as the $84 replacement drive from toad (much less a mega with tos2.06 and HD and a gigabyte of ram and video cards and...) so please don't even suggest that sort of thing unless you're offering it as a gift.

A reputable surplus electronics dealer (Tucker Electronics) sold me the Sony drive new (sealed in cellophane) and a standard xt cable (in case

I need to cut and twist or run extra length) for well under $50, still more than I can afford.
Sadly, he also gave me the insects and dishwater look that says it's a good drive, but it won't turn a hairdryer into a computer.

If I
manage this fix, I'll gladly write out instructions and Tucker's phone/address since they have several of those drives in stock.

Thanks for the advice and encouragement.

2303. Re: How do I write a cookie?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-04 17:34:54 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <CpAGu6.2BB@cix.compulink.co.uk>
Source record: 32988
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

>What I would specifically like to know, is how to write a High Density
>Disk Drive cookie.
TOSes after 1.6 will write a _FDC cookie automatically (this is installed by
TOS and is an official Atari cookie) for tyhe type of disk drive installed.
All cookie values are longs and the high byte here indicates the highest
dewnsity floppy
0 = 360/720K DD
1 = 1.44Mb HD
2 = 2.88Mb ED

The low 3 bytes give an indication of where the drive came from. 'ATC' means
Atari line fitted.

So, on TOS 2.06 the cookie will already be there.

Regards
Mark

>But that won't help you either if CONTROL.ACC isn't loaded!
yes, true - I forgot to add that a ROCP (Read Only Control Panel) auto
program is needed which reads the AES Internal Shell Buffer (the copy of the
INF file in memory) and sets the relevent settings at boot up.

>Btw, if you change DESKTOP/NEWDESK.INF, make sure that there are
>exactly 128 bytes (including CRLF) in the first four lines, otherwise
>the next time you save your desktop the file will be garbled.
erm, no.
the first 4 lines of an INF file are typically something like

#a040021
#b001100
#c77700070006000700552005055522207705570750555077020115 01
#d

which is 83 bytes including CRLFs. These lines are the same length under
all TOSes and have exactly the same meaning for all items contained therein.
(I've done a full breakdown of all the INF file format.)

Regards
Mark

Actaully, like most languages do, the vowels that don't contribute a whole lot
to meaning are all being reduced slowly to schwa, especially in an unstressed
position.

Here's an interesting thing to ponder. You take old languages like Latin, or
even worse, ancient ones like classical Hebrew and Arabic, and you get
EXTREMELY complex, yet very organized languaged. Then you take modern
languages like english, french, spanish, etc. and you find languages that are
much simpler in structure, yet a lot more disorganized. Now, tell me... how
did the grunts of the cavemen turn into such tremendously complex and highly
organized languages, when it seems that the TREND is toward simplification and
disorder?

Well, considering you'd need a TEC (or similar) board to use TOS 2.06
on a standard ST, it might be cheaper for him to simply get the TOS 1.4's and
simply swap in the new for the old chips...

I'm using a program called "noclick.prg" that resides in the auto folder.
Works perfectly, but why didn't Atari turn the keyclick OFF as a default,
so that you could turn it on with the control panel etc?
Who uses that annoying clikc anyway?

.......(snip).........

I don't know if this would help, but there's a program that I use in my auto folder called "hd_fdc.prg" which changes the steprate of the drive (I use it because when I changed over to TOS 2.06, my drive started to be really noisy!), anyway it adds a "High density" option in the format menu on the desktop.
Hmmmm.... maybe I'm way off subject here....

2310. Circuit for internal speaker wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-05 01:35:28 UTC
From: hallvart@ifi.uio.no
Message-ID: <2q9ih0$8f5@yrsa.ifi.uio.no>
Source record: 32892

I'm using an NEC Multisync monitor and there's no speaker in it, so I decided to make my own internal speaker in the STE, connected to an amplifier.
I've made it, and it works, but not too well, at certain levels the sound is really bad (and I don't necessarily mean distortion at high levels, but at certain levels, both high and low). And the speaker, although a small one takes up too much space if I should expand my STE even more.

Does anyone have a small circuit for getting internal sound of my STE, and possibly use a piezo buzzer or something really small, since I'm thinking of adding an internal hard disk (IDE) to it later on. I could put the piezo element underneath the keyboard, and the same with the amplifier if it was small enough.
I'm not expecting any "hi-fi" system here, just enough to get audio feedback with "beep" sounds etc.

From: ad869@FreeNet.Carleton.CA
Message-ID: <CpBAxo.86u@freenet.carleton.ca>
Source record: 32896

I have a 1040 STf with a Sm124 monitor. When I power the system up, the screen is all full of static and vertical lines of snow. This problem dissappears after a few minutes. It does not seem to affect the operation of programs, but is worrisome. I think its the computer since I have been told the monitor worked ok on another machine.

Has anyone had this problem, and if so, what solved it?

2313. C compiler for JOVE port

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-05 06:25:04 UTC
From: hugh@cs.toronto.edu
Message-ID: <94May5.022437edt.48142@neat.cs.toronto.edu>
Source record: 32893

I and some others are preparing a new release of JOVE, an EMACS subset editor with modest resource requirements. JOVE works on UNIX and MSDOS. At one time it worked on the Mac and the Atari ST.

As an (inactive) Atari ST owner, I'd like to make the new release work under TOS. I tried Mark Williams C and Heat & Serve C, but both seem to have serious compatibility problems. In fact, I was in communication with Ian Lepore about these problems when he seems to have disappeared.

1) Does anyone want to try to port JOVE? I can make the working source available, and perhaps some hints?

2) Does anyone have advice for a "normal" C compiler that I don't have to pay for or work hard at? I only have about 2M of hard disk space on my ST (enough for Alcyon C, MWC, or HSC). By normal, I mean similar to ANSI C, K&R C under UNIX, or MicroSoft C under MSDOS. I also have a Sun with somewhat more disk space free -- is it easy to set up a GCC cross-compilation system?

I hate it when people say this, but I rarely read this group. Could you reply to hugh@mimosa.com?

I (used to) have a copy of _The Battle of Maldon_ somewhere, and I'm pretty sure there are eths in it. Sir Gawain and the Green Knight also uses a letter like a backwards z or a dropped 3, to represent the ``gh'' sound missing from modern English but still present in Dutch (written as G in ``Gent'', ``Brugge''). As in Grene Kni3t. However I don't think this letter was used in Anglo Saxon, and it's not needed for Old Norse or modern Icelandic.

> organized languages, when it seems that the TREND is toward simplification and
> disorder?

The ``classical'' languages were used by an educated elite, or even by a priesthood, partly for communication between themselves but also a medium for poetry and magic. Communication between educated people will tend to favour a highly organised language; poetry and magic favour flexibility of construction and complexity. These ``classical'' languages were either rarified abstractions from the language of the street, or even purely literary languages unconnected to those of Real Life (e.g. classical Sanskrit).

With the advent of cheap printing technology, radio, television, and mass literacy (of a sort :[), it becomes inevitable that most written communication (and literary expression) will make use of the ``vulgar tongue'', which often means something extracted by a covey of monks out of the grunts of their troglodyte neighbours. Depending on the temperament of your monks, the result may still be rather complex (modern German or the Slavic languages) or fairly simple (e.g. Italian, thankyou St. Francis and thankyou too Mr. Dante).

The only case I know of where a ``classical'' language has grown into a modern language without undergoing radical changes is Old Norse -> Icelandic, an anomaly arising out of the isolation of medieval Iceland and the literacy of its inhabitants. Just how much the ON of the Saga resembles modern-day conversational Icelandic I really can't say, maybe we should move this one to soc.culture.iceland (if there is one).

>Has anyone had this problem, and if so, what solved it?

Yup, I had exactly this problem after I upgraded my ST to 4mb RAM.
The symptoms are quite worrisome as it looks initially as if the
RAM is dropping bits. ie. random pixels flickering only in Mono mode.
(Doesn't happen in low/med resolutions.) However, after running some
memory diagnostics on my system, I could find no problems.

I cured it by re-seating the 40 pin Video chip (shifter?) located
under the RFI shielding, plus re-routing the ribbon cable from the
shifter to the 4Mb RAM expansion board. I guess the shifter was just
dropping bits at random when reading RAM. Mind you, the socket the
shifter chip was in should be cut out and replaced since it's one
of those crappy sockets that's good for only about 2 insertion/
removal cycles!

Cheers, Steve

Hello freaks!

Is there anybody running with SmartNet and have some experiences with it?

I use 2 HD's and have a PC with streamer, but can't backup the files on this moment (only using the serial port, but this is so slow...) and SmartNet is working using the parallel printer port. It's also possible to access the PC drive from the ST.

All info is welcome!

Greetings,
Koos

-------------

Are you saying that English had a VOICED velar fricative? Ie, 'gh'? How
interesting. How was the unvoiced velar fricative written?

In regard to our discussion of the complexity of the languages, yes, I can see
what you're saying... the written 'classical' languages tend to be somewhat
removed from the every-day spoken tongue.

But what about Biblical Hebrew? I'm sure quite a bit of it could be polished,
educated Hebrew, but what about direct quotes? That is to say, the quotes
that were written down at about the time they were said, not the ones that
were written down hundreds of years later. There is a lot of text in the OT
that is just simply things that people said. Biblical Hebrew is VERY complex,
so much so, in fact, that Modern Hebrew speakers have trouble with it, and
Hebrew is one of the oldest know recorded languages. I would suspect that
much of Biblical Hebrew us written in the common tongue, so it would give us a
very good indication of the complexity of languages back then.

So, what of it? With the trend toward simplicity, how could a language like
Hebrew evolve from cave-men grunts?

ST used the toggling of the write protect line to indicate disk change

Tos polls the disk drives all the time, on some machines you can see the led
flicker, from this poll it gets the status of the write protect line from
the drive..

On some drives, Atari ones as well, will toggle this line when ever
a disk is changed no matter were the disk write protect tab is, and this is the
way Atari intended it to work, but there are some Ataries fitted with
Chinon drives did not work, there was a fix for this, to short out the disk in
switch, but then the drive would allways run......

But a lot of drives don't toggle the write protect line when the drive is write
enabled..

I think there was talk about connecting pin 26-2 on the drive, pin 2 can be
assign as disk change on some drives....

I have tried this on one drive, but it did not work..

What we need is a list of drive that do work the way Atari requires...

There has been a lot of talk about Teac Drives, may be these work...!!

Any one else got any info on this problem....

Excerpts from netnews.comp.sys.atari.st.tech: 4-May-94 Re: Zoo for Minix
by Frank Bartels@nasim.sta.
> If you are looking for a zoo-Binary which works fine on a Minix-filesystem
> and is shareable under MiNT ask archie for 'bmintzoo'.

Got it, and it works great. As far as getting Compress to work, I'm
still lost. I replaced all my include, lib, and gcc relevent binaries,
but I'm still getting parse errors. Somebody suggested that compiler.h
and/or types.h weren't included where they should be, but I'm not yet
experienced enough to use this info. My guess is this isn't going to be
easily answered withought giving a detailed description of my system.
Let's see if I can try a different approch.
I would like a version of compress that will work with Mint, be able
to use Minix file names, and run on a TT (of course I want uncompress
and zcat with that, but from what I've seen I can just link those).
Since I can't seem to get them to compile, I'd prefer a source of the
binary.
Also, why I'm at it, could somebody point me to a complete set of
gcc files for the same setup. I'm trying to get my system setup for the
summer (at which point I won't have net access) so I'd prefer a version
that's going to be stable.

(If you know one of the files is on umich, tell me about that... It's
the easiest place for me to get stuff)

Thanks!

2324. Re: STe's extra joystick ports

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-06 05:19:26 UTC
From: Ted.Miller@crypt.dswhq.omahug.org
Message-ID: <7c0_9405052350@dswhq.omahug.org>
Source record: 32918

In a message of <21 Apr 94 00:11:50>, Jerry L. Chappell (1:286/2) writes:
JL> Someone must have the pinout for the 15-pin (extra) joystick ports on
JL> the Atari 1040STe. I need to know what these pins do, and what
JL> addressed to access in the memory map in order to access the ports.
JL> Thanks for any information on this topic.

According to the Falcon030 Owner's manual Rev. B (Page E-6), the pinouts to
the STe Enhanced joysticks are as follows:

```
--------------
5 | * * * * * | 1
10 | * * * * * | 6
15 \ * * * * * / 11
------------
```

Port A Port B
Pin Signal Pin Signal
1 UP 0 1 UP 1
2 DOWN 0 2 DOWN 1
3 LT 0 3 LT 1
4 RT 0 4 RT 1
5 PAD0Y 5 PAD1Y
6 FIRE 0/LIGHT GUN 6 FIRE 1
7 VCC (+5VDC) 7 VCC
8 not connected 8 not connected
9 GND 9 GND
10 FIRE 2 10 FIRE 3
11 UP 2 11 UP 3
12 DOWN 2 12 DOWN 3
13 LT 2 13 LT 3
14 RT 2 14 RT 3
15 PAD0X 15 PAD1X

According to pages 5.8 and 5.9 of the Atari Compendium (which you should get
if you don't already own one :-) (Note: the method to read joysticks is
COMPLETELY different than the method used to read paddles)

"To read the joystick, write a mask value corresponding to the row of
keys/positions you wish to interrogate to 0xFF9202. Next, read back a WORD
from either 0xFF9200 or 0xFF9202. As indicated in the table, cleared bits
mean that a key is being pressed or a joystick is moved in that direction."

And the tables in the compendium:

```
----------------------------------------
| Read Controller 0 at 0xFF9200 |
```

```
|--------------------------------------|
| Write Mask | Bit 0 Clear | Bit 1 Clear |
|------------+-------------+-------------|
| 0xFFFE | Pause | Fire 0 |
|------------+-------------+-------------|
| 0xFFFD | - | Fire 1 |
|------------+-------------+-------------|
| 0xFFFB | - | Fire 2 |
|------------+-------------+-------------|
| 0xFFF7 | - | Option |
'--------------------------------------'

_______________________________________
| Read Controller 1 at 0xFF9200 |
|---------------------------------------|
| Write Mask | Bit 2 Clear | Bit 3 Clear |
|------------+-------------+-------------|
| 0xFFEF | Pause | Fire 0 |
|------------+-------------+-------------|
| 0xFFDF | - | Fire 1 |
|------------+-------------+-------------|
| 0xFFBF | - | Fire 2 |
|------------+-------------+-------------|
| 0xFF7F | - | Option |
'---------------------------------------'

_____________________________________________________________________
| Read Controller 0 at 0xFF9202 |
|-----------------------------------------------------------------------|
| Write Mask | Bit 8 Clear | Bit 9 Clear | Bit 10 Clear | Bit 11 Clear |
|------------+-------------+-------------+--------------+--------------|
| 0xFFFE | Up | Down | Left | Right |
|------------+-------------+-------------+--------------+--------------|
| 0xFFFD | Key * | Key 7 | Key 4 | Key 1 |
|------------+-------------+-------------+--------------+--------------|
| 0xFFFB | Key 0 | Key 8 | Key 5 | Key 2 |
|------------+-------------+-------------+--------------+--------------|
| 0xFFF7 | Key # | Key 9 | Key 6 | Key 3 |
'-----------------------------------------------------------------------'

_____________________________________________________________________
| Read Controller 1 at 0xFF9202 |
|-----------------------------------------------------------------------|
| Mask | Bit 12 Clear| Bit 13 Clear| Bit 14 Clear | Bit 15 Clear |
|------------+-------------+-------------+--------------+--------------|
| 0xFFEF | Up | Down | Left | Right |
|------------+-------------+-------------+--------------+--------------|
| 0xFFDF | Key * | Key 7 | Key 4 | Key 1 |
|------------+-------------+-------------+--------------+--------------|
| 0xFFBF | Key 0 | Key 8 | Key 5 | Key 2 |
|------------+-------------+-------------+--------------+--------------|
```

```
| 0xFF7F | Key # | Key 9 | Key 6 | Key 3 |
'-------------------------------------------------------------------'
```

The Compendium goes on to explain how to read paddles:

"Two paddles may be plugged into each joystick port. Each paddle returns an 8-bit value indicating it's position (0 = full counter-clockwise, 255 = full clockwise) at the addresses shown below. Unlike joysticks, paddle positions are returned automatically with no need to write to an address prior to a read. Paddle fire buttons, however, are mapped and read in the same manner as the joysticks. See the explanation of joysticks above for an explanation."

And the paddle table from the Compendium:

```
_____________________________
| Reading Paddle Controller |
|---------------------------|
| Byte Addrss | Paddle      |
|-------------+-------------|
| 0xFF9211 | X Paddle 0     |
|-------------+-------------|
| 0xFF9213 | Y Paddle 0     |
|-------------+-------------|
| 0xFF9215 | X Paddle 1     |
|-------------+-------------|
| 0xFF9217 | Y Paddle 1     |
'---------------------------'
```

And finally, the Atari Compendium explains how to read light guns/pens from the STe/Falcon Enhanced joystick ports:

"Joystick port 0 supports a light gun or pen. The position that the gun is pointing to is returned in the WORD registers at 0xFF9220 (X position) and 0xFF9222 (Y position). Only the lower 10 bits are significant giving a range of values from 0-1023."

The Atari Compendium by Scott Sanders is available from:

There are some german CDs (two from Bernd Lohrum, one from a PD
seller (Wohlfahrtstaetter)).

> - SCSI drivers that USE DMA !!! CD-ROM (and Harddisc)
> access take up much too much time under MultiTOS.

They use DMA, but the system is locked. That's normal with the current
'model' of drivers in TOS and MultiTOS. Expect to get better performance
with future releases of Mag!x (where the whole kernel is reentrant
and drivers can be interrupt driven).

> - An audio disc player program for this CD-ROM drive...

Why don't you use the one which is shipping with CD-Tool?

|> (I've done a full breakdown of all the INF file format.)

You are forgetting the whitespace in the #d line, which is vital! At least until TOS 3.06, if you delete this whitespace, the next time you save the desktop the file gets garbled, because the desktop starts saving its data at exactly 128 bytes from the beginning of the file. But when parsing the file at startup, it starts from the beginning, and gets confused by some incomplete lines in the first 128 bytes of the file. Typically, some of the #W lines are overwritten in the middle.

2327. SCC serial ports

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-06 09:40:08 UTC
From: Ted.Miller@crypt.dswhq.omahug.org
Message-ID: <7c1_9405060451@dswhq.omahug.org>
Source record: 32919

I have a question for all you programming people...

I know *WHERE* in memory to go to access the SCC chip that controls the serial ports in the Megs STe/TT/Falcon. However, I have no idea what VALUES to send to the SCC for different things.

What I really want to know how to do is to set the SCC so that the port(s) are locked at a baud rate of 38400, 57600, and 115200.

Anyone know how to program the SCC chip in these machines???

Any help is appreciated.

:> counter.. 4Mbit chips (used on 3 chip SIMMs) need all ten bits, where
:> 1Mbit chips (on 9 chip SIMMs) use only nine bits...

DO you know how the refresh works? I've tried to get info about it for a long
time... and I need to know to make a Fast RAM card... some info about
DRAM refresh controller logic (perhaps 74ALS1750 or so) would be VERY useful...
I don't want to use SRAMS; would be a bit expensive :-(

You might get a problem; the 1040ST might be unable to work with Maxtor HD's.
Mega ST's and Mega STE's don't have that problem.

Good luck!

On this subject...

Once MINTnet gets TCP running I'll probably do another release containing
the utilities from it and add libresolv.a etc., and a version of syslog which
is net-aware.

Anyway, back to the real reason for this post.

>This is great, but getty then displays a garbage prompt. The prompt sorts itself

>login prompt is from login.ttp not getty).
>
>You can still log in however, so it just looks a bit untidy.

Can you give me an idea as to what the "garbage" looks like, it could be
parity problems. (By the way... login.ttp what's that? :-))

>PROBLEM 2
>==========
>
>I can't persuade wlogin to work - it crashes well bad when I run it.

Hmm.. I'll have a look at that. I must admit I've not even looked at this
program's code, it's all Dave Gymer's work.

Yes, but... This lets yuo switch between version so that any incompatabilities
can be solved.

Also, the improvements in TOS2.06 make the extra (minimal)cost worth-while.

OK, so it could still be improved but it's a lot better than any previous
version.

One thing I would like to see is 8*8 characters used in menus when in hi-res.

: >Hallvard, Oslo, Norway

I have keyclick on and rely on it.

Unfortunately, keyclick is the *loudest* sound the computer is capable of making without assistance. And I don't want to deafen the neighbors with my typing. So in order to have keyclick on (which I need as a feedback mechanism) I have to turn the monitor volume way, way down and any program which tries to use sound loses something...

2335. Problem with Emacs and Mint 1.10

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-07 04:01:30 UTC
From: dehall@iastate.edu
Message-ID: <dehall.768283290@vincent2.iastate.edu>
Source record: 32913

I have been using the version of Emacs for Mint which is on a.a in the Mint directory. Since moving to Mint 1.10 a couple days ago, Emacs' response has been vvvvvveeeeeeeerrrrrryyyyyyyy sssssslllllllooooooowwwwww..... What I mean is, Emacs takes about 30 seconds to respond to a keystroke. When it does respond, it will respond to as many keys as you have pressed (it acts like a type-ahead buffer).

Anyone have any clue as to the problem? Or more importantly, a fix? :-)

Thanks,

Aaron Burghardt

I'm thinking about upgrading my 520STE's 720KB disk drive with a 1.44MB
one. What kind of drive can I use- a standard PC type?
I'm asking, because they seem to be quite reasonable, since there's
so much competition in the PC market.
What else do I need- the special chop (forgot it's name)?
Is there anything else that I need in order to be able to use
1.44MB disks with my STE?

Hallvard, Oslo, Norway

Forget about compress and use gzip.
Gzip is from GNU and compiles fine on Atari (the atari port is even
included in the standard GNU distribution, which is exceptionally
rare). It is availbale in source form and compiled form somewhere on
the atari archive.
It doesn't do 'compress' but does 'uncompress'. And its compression
algorithm is REAL good. And it's faster than uncompress.
And it's totally free from any patent (that's why it doesn't do
'compress' which is patented (as opposed to 'uncompress')).

Source record: 32920

Hi,

Does anybody out there know where I could pick up the following pieces of equipment:

1) A power cord to an RGB Analog Color SC1224 Monitor. (I believe this is a standard cord for most any monitors; please correct me if I'm wrong).
2) Power adapter for an Atari 520ST computer.
3) Video cable (that connects the monitor to the computer).

Does Atari still exist in Sunnyvale California? Is there an address that I can snail mail, or internet mail them for information about sending me the above stuff?

Could the kind soul who answers this e-mail me directly as well as post to this group? It would save me some time.

Any help would be appreciated,
Nemo De Furia.

My Profibuch states that the whole SCSI handling in the TT is driven by the
CPU and not by DMA.... So I'm not sure what to believe.

>Why don't you use the one which is shipping with CD-Tool?

Simple... It does not work with THIS NEC 210 CD rom drive.... I don't know
why, but it just doesn't. The activity light on the CD-ROM drive flashes
constantly and when I click on the button's the pattern of lfashes changes
but it doesn't start playing... On the PC under Windoze it works OK.
(crosslinked the SCSI ports of the TT and PC :-)

> files, Gas version 1.38p4, and Gcc version 2.53. When I try to compile

gcc 2.5.3 is not recommended for 680x0! Get gcc-2.3.3 or gcc-2.5.8 if
you always have enough memory.

> Compress, I get the following errors:

> # make -f makefile.minix compress

Remember again: Minix is an Operating System and has nothing to do
with MiNT! All you use is the Minix-Filesystem!

> gcc -DMINIX -DUNIX -DNDEBUG -traditional -U__GNUC__ -O -mint -c
> compress.c -o compress.o

Hmm. -mint is not needed if you rename the MiNT-Library to their GNU
equivalents. And I don't think -U__GNUC__ is a good idea.

> In file included from compress.c:100:
> /usr/include\\stdio.h:20: parse error before `size_t'
^^
Get a compiler linked with the MiNT-Library. Use 'ident' or 'strings'
to find out the used Library.

2346. Atari and Homenet

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-08 15:13:14 UTC
From: jpoling@magnus.acs.ohio-state.edu
Message-ID: <2qivia$r5q@charm.magnus.acs.ohio-state.edu>
Source record: 32929
Cross-posted to: osu.general,oh.general,comp.sys.atari.st,comp.sys.atari.st.tech,rec

Do you own an Atari ST/TT/Falcon030? Are you also an Ohio State
Student who wants to join the Homenet switchover, but don't know how? Do
you want to learn about client/server software for the Motorola based
Atari machines?

Then visit the Atari Computer Enthusiasts of Columbus this Wednesday,
May 11, at 7:30pm at

Chemical Abstracts
2540 Olentangy River Rd.
1/4 mile North of Lane Avenue
Across from the Woody Hayes practice facility
Next to the Fawcett Center for Tomorrow

We will have a speaker discussing his company's service and Internet.
The meeting will also include an overview of client/server software
available for the Atari 680x0 line of computers.

If Atari is your primary platform and you don't wish to be left in
the dust by the movement to client/server networks, be sure to be there
Wednesday!

> But I'm not absolutely sure [Hi Peter ;-)]

You do need an additional chip, but you might have it already depending on
the vintage of your machine. Viewed from the front, there is a horizontal
line of three chip sockets. The outer two should be filled. The middle
one is the coprocessor related one. If you have it, you should just have
to pop in a 68881 or 68882 into the PLCC socket.

>Mega ST's and Mega STE's don't have that problem.

Hmm, at least with the Maxtor 7245S, there are problems with the internal
Mega STe hostadapter (if I remember correctly, we had to cut the SCSI reset
line on the cable to make it work).
I have here a Maxtor 7345S, which runs without problems on TT (internal
SCSI), Mega ST and 1040ST (Top_Link hostadapter).

From: munden@saturn.wwc.edu
Message-ID: <munden.8.0@saturn.wwc.edu>
Source record: 32933

Hey there fellow Atari Users,

It's been a long time since I used my old Mega ST 2 and I didn't even know if they (the computers) were still being produced. I loved that old computer, but gave up when I could only get software through mail order and the software companies kept going out of business.

Anyway on to the background on my question. I own many of the Cyber STudio series of products and loved doing animation with them, especially CyberPaint. I really haven't found anything as easy and fun to use on another platform.

My question however is, IS THERE ANYWAY I CAN GET THESE ANIMATIONS TRANSFERRED INTO A FORMAT FOR WINDOWS ON THE PC???

For instance, can they be changed into AVI or FLI or MPG files with any program anyone knows of??

Serious Thanks in advance for any information that anyone can provide.

Rico Mundy

Dear Rico,

there are several converter programs available from Lexicor
Software, if you want some more details you can email me at ysiu@lexicor.com

If you have ftp access you can infact ftp to ftp.std.com and
get the seq->flm converter which can then be converted into an fli using
flm->fli. The other option would be to save them off as single frames and
re-build them with one of our gif/tga to flm/fli/c/x builders.

I hope this helps a little

and information on that product will be emailed to you privately providing we have it...a list of the products of which we have information shall follow soon. This will at least ensure that not everbody will want to get all the product info and are forced to get it too.

* INFORMATION ABOUT SUBSCRIBING AND IDEA *

This is a new mailing list, and is meant to combine all user's on every service may it be free or commercial in one bundle, so GENIE user's, Compuserve, cix, maus, fido, delphi etc. all with internet connections to a general Atari Graphics Forum...sponsored by Lexicor Software Corporation.

This mailing list is now officially opened at the 4th October 1993, many thanks go to the staff at world.std.com, the oldest public internet service in the U.S.A. for their support.

* TO THE LEXICOR AND GRAPHICS MAILING LIST *

Welcome to the Lexicor Software and general Atari Graphics Information Mailing-List.

I welcome you all to this new mailing list which will discuss the new graphics hard & software that is available for the old as well as the new Atari Hardware.

Of course, Lexicor hard & software products will be discussed, as well as other hard & soft products for Atari. It matter's not that a Lexicor has opened this general mailing list, as the other members of the graphics list are there to shift and talk to whatever field they like (on and around Atari Graphics).

By Atari Hardware I mean from the old 520 STFM line, 1040 STE upto the MEGA STE's, TT'030's and naturally Falcon'030's. I will try to scoop up the newest information I can get, as well as I will be relying a little on what you might dig up, and discuss about the latest Atari Events concerning graphics around the Atari World.

But Atari Graphics goes also into the realms of general graphics question and answer painting tools, about discussions of rendering and raytracing techniques, and consequently about the production of faster machines (much needed for fast raytracing) such as the TT-Clone from GeSOFT called the "Eagle" or the Medusa both from Europe which have 50 MHZ 68030 and/or even 68040.

Atari Graphics is also about Desktop Video, Genlocking, Desktop Publishing, 2D or 3D Animation, rendering, raytracing, pixel painting, drafting, there are so many of them...I could never list them all.

We might even be discussing the potential of the Jaguar as a future external graphics tool..controlled via th Falcon as the ultimate low-

cost graphics workstation! (Optimist I am!) Future plans..and ideas are welcomed!

I hope you enjoy this new experimental mailing list.

Have fun!!

Hee hee. Hahmpf! Blah Ha Ha Ha ..... !!

Whooh.

(Sorry; no offense---I couldn't contain myself.)

Probably 99% of the Old Testament was not written contemporarily with its
subject matter. Any parts that were are unlikely to contain direct quotes.
The best information I have seen says that the Old Testament in the form we
know it was compiled during the ``Babylonian captivity'' (circa 650 B.C.
or so). The historical accounts are largely reworkings of older material,
and the stories of Job, etc., can only be considered apocryphal by the
nonfaithful. (FYI: If memory serves, the oldest, ``least-reworked'' books
are believed to be 1 & 2 Chronicles.)

It would be fortunate if it were otherwise, but....

You're accessing the sound chip's selection and data registers.
By writing into $ff8800, you select a sound chip register; in this
case register 14 which mirrors the state of one of the sound chip's
two I/O ports. After selecting a register, it "appears" under $ff8802.
The drive selection lines on the Shugart bus are connected to this
port. I think the lower three bits of this port mean the following:

bit 0 side selection
bit 1 /SEL0
bit 2 /SEL1

This is off of my head, so I could be totally wrong here, but it fits
with your sample program. Note that all these lines are active low. You
shouldn't just 'poke' absolute values into the port, though, but OR/AND
the right values into the selection bits in order not to mess up any
other selections in this port.

Note that there's no bit to switch on the floppy light - these
lines are only meant to *select* a drive. It's up to the drive
when to light up its LED, but practically all of them switch
it on when they are selected.

There's also an XBIOS function call to access the sound chip under
OS control. This is probably a better choice than banging on the
hardware - at least if you don't need a speed demon and you're
not switching on or off the lights from within an interrupt handler.

2357. Writing portable HiColour rasters

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-09 08:16:03 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <2qkrg3$hon@percy.cs.bham.ac.uk>
Source record: 32938

(Or HiColor, if you like ;-)

How do you write pixels to a VDI format HC or TC raster in a portable way? The only way I've found that *appears* to work on a Crazy Dots II and NVDI ET4000 combo is:

1) set a pen to the desired colour.
2) plot a pixel in that colour to (0,0) using v_pmarker.
3) get the HC pixel using v_get_pixel(0,0)
4) store the pixel in a short[] (or long[] if TC), assuming it is ordered from top to bottom, left to right.

The situation I'm doing this in only requires 16 colours, so I can simply store the 16 returned values in a lookup table, so the VDI overhead will not be there. I can't think of a way to portably and quickly write lots of colours though.

But I don't know if what I'm doing will ever work on other graphics cards, or the Falcon. The word returned by v_get_pixel is *not* structured the same way as the Lattice documentation states, which concerns me a little.

My first foray into HiColour has left me a bit puzzled...

Thanks for any help!

2358. F030 BLiTTER IRQ

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-09 08:47:49 UTC
From: ep93dha@t.hfb.se
Message-ID: <1994May9.084749.14787@t.hfb.se>
Source record: 32940

I have a problem with the F030 blitter.
I want to use the blitter in non-hog mode while the CPU doing something else.
The idea is to set up a list of jobs for the blitter and interrupt the CPU
everytime a job has finished, start the next blitter job and then let the
CPU continue with what it was doing. To do this I need to know how to produce
an interrupt when a blitter operation has finished.
On the STE the blitter BUSY bit is connected to the MFP I/O bit #3, so it is
possible to let the MFP detect the state of the BUSY bit and produce and interrupt
if a change occur. However, THIS DOES NOT WORK ON THE FALCON! Why?

I'd like to know the answer to this too, so that I can put it on hensa.

: 2) What is ".ttp" suffix such as cat.ttp or sed.ttp?

ttp stands for 'tos takes parameters', so when you click on this icon,
or run the program with this extension, you enter parameters, just like
a CLI. For example, parameters for lharc.ttp, once you've clicked on
the program would be enetered as
x <filename.lzh> ; to extract the files
v <filename.lzh> ;for a verbose listing of files

Hope this helps.

Danny.

2363. UK TV Standard

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-09 10:52:46 UTC
From: phiga@uhunix.tmc.edu
Message-ID: <CpJ7Jz.K9@news.Hawaii.Edu>
Source record: 32795

I have a question regarding an Atari ST from England as compared to one produced in the US. I believe that the standards when it comes to TV video output are different - NTSC (or something) vs. PAL (i believe)
Now... I have a UK ST being used in the US and have figured out how to get the ST working on UHF channel 34 (with only in B+W tho) and no sound.
I fixed the sound problem by jury rigging wires to my stereo system from the monitor port... Now the only thing left that bugs me is the inability to get color...
I can't spend any money on this,so please sont suggest buying a color monitor!
What i _can_ do is wire stuff up/mess with system junk etc.
Any help would be greatly appreciated in getting my ST working fully on a US Television

2364. Re: Turn off keyclick -- here's how

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-09 11:03:35 UTC
From: pagan@meiko.co.uk
Message-ID: <2ql5a7$c3l@bart.meiko.com>
Source record: 32796

At address $484 the longword controls various keybaord stuff:

bit does

0 keyclick on/off
1 keyboard repeat on/off
2 bell after ctrl-g on/off
3-31 return entry for BIOS kbshift function.

I know that at least the keyclick entry is correct coz I have a wee
autoboot program running on both my ST and Falcon that turns it off.
You have to be in super mode to hack this address of course.

I have 3ea Atari 520ST computers for sale w/SC1224 monitors and SF354 drives. I have no cables or software. I bought them at an auction and someone else got the cables. I have no way of knowing if they work but they look in real good shape. The party that sold them was changing over to PC compatibles. I will let each system go for $35.00 plus shippiong. I will send COD.

Thanks ,
Rick Engelbrecht

Hm, good point. I'll have to check up on that one. Gh was a velar fricative
of some kind, which is why it is pronounced in so many ways in modern English
(when it is pronounced at all). Of course the unvoiced form in modern Scots
English is written `ch'.

Hm, I'm not a regular OT reader... however I didn't think that there was an
awful lot of stuff there that claimed to be verbatim. The oldest books,
such as Job and the Song of Songs, are pure literature, as are the prophetic
books and the Psalms. So the only real quoted speech would be in the historical
books.

What sort of resistance are we talking about? I know I'm not supposed to
sample directly from line level, but I've done it a couple of times with
the volume turned way down. I could do with a proper solution though. Care
to make any suggestions on how things should be set up properly?

2369. Adaptec ACB4000 jumper pinout

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-09 13:50:54 UTC
From: nisimura@sra.co.jp
Message-ID: <2qlf3u$q8a@sran230.sra.co.jp>
Source record: 32826

I got a bare aged Adaptec ACB4000 ST412-SCSI adaptor board without any information. I would like to know the meaning of onboard jumpers.

Here is a short story resulted in vain.

Several months ago, our company dumped a pile of computer junks including a complete set of VAX-785 (!!) and so many old-fashioned equipments. I found the Adaptec board just before recyclers arrived. I found also RD53 for uVAX-II. I remembered RD53 was relabeled Micropolis 1325 and SunOS (still) had /etc/format.dat data for ACB-4000 and Micropolis 1325 combination. I took them and tried to use with SS-2 and failed after one hour. SunOS format command did nothing useful other than discovering ACB-4000 board. Then I moved them to Mac and tried with Silverlining and SCSI director. It also resulted in vain.

ACB-4000 has 8 pairs of jumper on board. I found 3 pairs for SCSI ID. Others seem to be significant for right usage. Or, the board is simply broken. Someone out there still using ACB-4000, please let me know about the 8 pair of jumpers.

I am looking to buy a cheap system for running sequencing (prob. cubase or similar) packages on. It seems to me that an Atari ST or Commodore Amiga are probably my best bet. However, I don't know much about either, as I have always been brought up using PC's. (ie. how much ram do I need, do I need a hard drive etc. etc.)

Could anyone give me some advice/recommendations on what to buy? and could anyone please explain what the differences are between the Ataris (ST/STE/STF/STFM...) and the Amigas (500/600/1200/1500/2000). Finally, could you let me know what I should expect to pay secondhand for a reasonable setup. (AND IF YOU HAVE ANY SYSTEMS FOR SALE, PLEASE GET IN TOUCH - I have cash waiting). Thanks very much.

2372. Problems with f2c and gcc 2.5.8

Newsgroup: comp.sys.atari.st.tech

From: Nils Øge Frøystein <Nils.Froystein@kj.uib.no>
Message-ID: <2qlgud$j07@alf.uib.no>
Source record: 32802

The last couple of days, I have tried to use the combination of f2c and GCC 2.5.8
to compile FORTRAN programs without any success. (I am using the MiNT libraries,
patchlevel 44). My machine is a Mega ST4 running TOS 2.06 and MiNT 1.09.

The f2c translation step seems to work, but I am not able to build an executable
file from the generated C source files, i.e. the following command (for any simple
FORTRAN program)

gcc -v hello.c -hello.tos -lf2cslow

produces a linker error message

main.o: Undefined symbol _main referenced from text

Does anybody know how I can get rid of this error?

>possible to let the MFP detect the state of the BUSY bit and produce and interrupt
>if a change occur. However, THIS DOES NOT WORK ON THE FALCON! Why?

Well the obvious asnwer seems to be 'because the Falcon doesn't have an
MFP chip!'.
Although most of the MFP chips functions are emulated by the SCC, not all
of them are, for reasons known only to Atari. This is why MFPint() doesn't
work on the Falcon.

This may not be the reason however, just my suggestion.

I don't think this can be done without expensive conversion equipment.
I did however see conversion boxes between NTSC/PAL in Hong Kong while travelling there a few months ago. They cost approx US$70 or something.
Does your television have any other kind of input than the antenna input?
If not, I don't think there is any solution (not a cheap one anyway).
You could try to ask in the "rec.video" newsgroup.

2376. host adapter

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-09 15:36:37 UTC
From: mhsmith@ornews.intel.com
Message-ID: <2qllam$2v6@ornews.intel.com>
Source record: 32809

Tell me if this is unrealistic:

Is there a host adapter made that can replace the internal host adapter of the Mega STE/TT and offer onboard read and write cache. Studies prove that read/write caching increases performance. With only four meg of RAM in a Mega STE (which is what I have), it's hard to dedicate 2 meg of that to a software cache. Onboard cache would be much faster.

So, does anyone know where or even if such a critter is available? I know ICD makes some internal hosts but I don't believe they have cache built in. I'm talking about at least 2 meg of cache that can be configured as write back cache.

Thanks,

Michael

I have never heard of an ST host adaptor with on board cache. However, unless you are really kicking the crap out of your disk, it is unlikely that you will perceive a large general increase in performance from such a big cache. If you set the ICD caches large enough to hold all FAT table information (the size of which depends upon the size of your partitions) plus about 32k more (this number can vary depending upon how your partitions are formatted), you will get a majority of the potential performance gain a cache can provide. Cache size is a diminishing return relation, so you might only get 10% additional performance when going from a 256k cache to a 2mb cache (again, on average). On the other hand, if you find yourself completely rewriting 2mb files a lot, you will obviously get better performance with a huge cache. It is easy to engineer an example where a 2mb cache will beat a smaller one by orders of magnitude, but it is unlikely that you work with 2mb files on an ST (on a regular basis, at least). Don't get me wrong, bigger is better. However, a lot bigger is generally not a lot better, with caching.

I played with my cache settings (using the ICD software) a lot, and found that I got very little return when going above about 256k total on my caches (there are several different types of caches within the ICD software). This was with my "normal" use of the machine. A tool that records cache hits is invaluable for making such a determination (ICD includes such a tool).

If you cannot use the ICD stuff, I suggest you try to find a copy of Cold Hard Cache, or its commercial incarnation Dcache. It has a nice acc that gives you cache stats. The best, as far as cache management and flexibility goes, is the ICD software (Pro level, if you don't have an ICD host adaptor).

I have had problems linking f2c programs with the mintlibs - instead I
tried linking with the original GCC libs, and it worked fine.. this
would be with gcc 2.3.3, mintlibs pl 30 (which didn't work with f2c) and
I am not sure which pl of the GCC libs..

I suspect that whoever compiled up the f2c lib didn't use -mint on his
compile line, and my distribution didn't come with the source.

Message-ID: <4528@btmwj1.se.bel.alcatel.be>
Source record: 32819

Note: I will use {\th} for thorn, {\dh} for eth, and {\gh} for yogh...

According to my edition of Sir Gawayn and {\th}e Grene Kny{\gh}t (Tolkien and Gordon 1925, 2nd ed. Davis 1967), {\gh} is used in the manuscript for four different sounds:

(i) the voiced front spirant or semivowel /j/, mainly as {\gh}e, {\gh}if, {\gh}onge... sometimes y is used for the same sound (as it is in modern English).

(ii) the voiceless front fricative before t, mainly from OE -ht but sometimes from EN -g{\dh}: my{\gh}t, ri{\gh}t, sle{\gh}t.

(iii) the sound /w/ derived from OE and ON back voiced fricative g; fol{\gh}e, sa{\ge}... also spelt w, and apparently pronounced that way too.

(iv) the voiceless back fricative in words with OE -ht after back vowels or final -h: a{\gh}t, o{\gh}t, pu{\gh}t; fla{\gh}, {\th}a{\gh}... sometimes written gh.

N.B. That was my summary of what Tolkien/Gordon/Davis have to say, blame me not them.

I conclude that 14th century English, as spoken in the Lancashire/Cheshire area, had the sounds of modern German ni-ch-t and na-ch-t, but not of modern Dutch -gr-oot or -g-oed. I apologise for any confusion caused by my earlier posting 8-0.

For music, my recommendations would be Mac, PC, Atari and Amiga, in that order.
(And I'm an AMIGA user). Cheap Amigas are much better computers than cheap Ataris,
but the Atari has always had built-in MIDI ports, and so there's much more professional
software available. There's a fair amount of PC-based hardware and software available too,
and particularly in the UK, the basic machine is cheaper than an equivalent Amiga.

The highest-quality software is on Macs, of course; and these aren't (so) outrageously
expensive any more.

Well, I solved my problem. I've now got my microphone going straight into
my Falcon and it records lovely. (Need to set max input gain though.)

I still do record from my stereo (for CD etc) from the headphone socket.

You are meant to put in resistors between your stereo and Falcon.
I don't - thats because I can't buy a little adapter or something with a
resistor built in, and I'm not an electronics wizz kid.

The resistor is there to protect your Falcon from line levels that are too
high. It is possible to blow up the input on your Falcon.

I go by these rules:

Before recording always set your stereo's volume to 0.
Set the Falcons input gain to minumum.
Do a test of your recording.
Listen to it...turn up stereo's volume slowly.
Make sure it doesn't distort - means the line level is too high.
Best to do this with headphones plugged into the Falcon.
Once you've got a level that doesn't distort -
turn down stereo some more to be safe!

Finally you can also check by seeing if your sample is clipping.
Also - check the whole section that you are recording - some of it might be
really loud. Dance type drumbeats for example.

Well - thats what I do. My Falcon is in tip top condition.

Phil.

2390. NVDI ET4000---Got It. But colours are not right

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-10 13:19:24 UTC
From: avg@cwi.nl
Message-ID: <CpL90D.C0J@cwi.nl>
Source record: 32821
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I got NVDI ET4000 for my Spektrum 1 card. It's great.
Speed gain is not enormous, but the software allows for 16
colour modes, which give an acceptable speed on a 32MHz
68030.

There's one problem though, and I hope someone on the
net knows how to solve it: the colour tables seem to be
wrong-endian, which is to say when I move the red slider
up, I get dark--light eight times as opposed to once.
An indication that the bits, nybbles or bytes are reversed,
if you ask me.

Does anyone know the ET4000 internal registers? Or have
a patch for the NVDI binary?

Is one of the Behne brothers listening to this group?

The cheapest setup would be a second hand Amiga 500+ or 600, (150 quid)
and grab a copy of Amiga Format (£4.95) from WHSmiths as it is giving away
MusicX free on the cover disk. £14.99 buys the manual. This is the best
and easiest sequencing package for the Amiga. You will also need a MIDI
interface (about 20-30 quid). Good multitasking computer!

The 500,600 are 16bit, the 1500 and 2000 are 16bit in a big box, 1200 is
32bit, 4000 is fast 32bit in big box.

A more pro set up would be a Mac and Cubase I suppose, but a Mac person
would be able to tell you more about this option. More expensive too.

By the way, hows things at IBM Havant. Used to work there during
the summer vacations from Portsmouth University. I was in Redwing working
on the 650Mb hard drives.

I think its called vg_text(), the vdi function to display text.
Anyway, the question is, Will this work in windows.
I.e., if i wanted to write a GEM text editor or something ?

Many thanks, Paul.

The best systems IMO are Atari, Mac, PC and Amiga in that order. The best program is probably Cubase, although there are others of similar quality. Cubase is available for the Atari, PC and Mac. The PC version is not as good as the other two. Also, if you're looking for a cheap setup, an Atari ST (in the UK) is 150UKP and sofware starts at 100UKP. This low cost ST requires a monitor (about 100UKP) and is capable of running Cubase as fast as a PC 486 or an 030 Mac. The ST has a built-in MIDI port, other systems require an extrenal one which starts at just under 100 UKP.

Be careful about buying Amigas. The word is out that Commodore is folding.
Don't know if anyone will pick up the Amiga line.

2397. Where to get gcc compiler & libraries?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-10 18:29:15 UTC
From: scott@hitachi.com
Message-ID: <scott-100594112533@137.168.16.46>
Source record: 32832

Is gcc for Atari public domain like the unix version? If so, where can I get my hands on a copy of it along with libraries. I have Acylon C compiler from the developers kit but its 10 years old now...way out dated, plus it isn't ANSI compatable!

Could someone point me to an ftp site where gcc lives?

Also looking for resource editors, documentation on functions for Atari system calls, etc. I plan on buying the Atari Compendium (sp?) but I want to get a stable compiler first...preferably without spending hundreds of dollars on a commercial C package.

Thanks in advance!!!!

Are you using the unmodified mint 1.10 sources ?
There are a *ton* of patches for mint 1.10, one of the first of which was
for a bug in select. It sounds like it is this bug you are experiencing.
If you want to have the patches, send me email and I'll email the patches
for you to chew on. (It should keep you busy for a while :-)

Erling
(who is running Emacs just fine on his *heavily modified* mint 1.10)

The original won't do though. On that Atari, the standard format is
IMG, and many people have LOTS of IMG clipart laying around. If we
don't make this easy for people to use, they aren't going to use it (so
we need an easy way for Atari users to create HTML documents, and we
need to support the most common Atari file formats as well as the
standard NCSA-endorsed formats).

> I'll e-mail you the NCSA "Recommended Document Format Specifications..

Thanks, got it.

I've just tried to install EMACS (wanted to try out html-helper-mode)
from down in the Mint tree and my performance is fine. Unfortunately,
it always whines about not finding /usr/local/emacs/lib or something
like that... it doesn't seem to affect things though, since the LISP
files appear to be found anyway.

What else is running in your system? I've got a heavily patched MiNT
1.10 (about 90% of the patches from the MiNT mailing list... I've missed
a few recent ones though), with the MiNT-net patches on it, and
sockdrv.xdd and minixfs.xfs loaded.

Hi.

I can tell you a little about the ATARI. I have used both the PC and the ATARI before. Right now I am using the ATARI. Let me say a little about the PC.

PCs are rather cheap nowadays. You can get a relatively powerful 486 machine and run CUBASE or WINCAKE on it. Personally, I prefer WINCAKE. You will also need a MIDI interface to hook it up to your synths. You can be sure that there will be more and more things out on the PC.

Now for the ATARI. I currently use an ATARI 1040STfm. Don't worry too much about the model. Basically, the first one is called the 520ST and the 1040ST. They differ in the amount of memory inside. Then, they added an RF modulator to it and called it the STfm. Then, they created another one using a faster chip, more flexible motherboard etc and called it the STe (for enhanced). Then they came out with the best ST so far called the FALCON (which is not really an ST...but anyway...you get the idea). I use NOTATOR/SL on my ATARI. Basically, it is a pattern based sequencer with notation facilities (way before CUBASE even thought about it...ha!). Now, if you have a harddisk, you can even run LOGIC on the ST (I run NOTATOR with just the floppy drive). With the ATARI, you do not have to buy anything else to run it with. If you get LOGIC, you will have an additional 3 midi ports to use.

If you need more info about NOTATOR/LOGIC and other stuff, you can send email to the forum logic-users-request@nessie.mcc.ac.uk and find out more. BTW, you can also run LOGIC on a MAC but it would cost more.

Hope this helps.

If you can type while looking elsewhere, you shouldn't need the click,
either... ;-)

Actually, I'm used to the mushy keyboard, so I don't need the annoying
keyclick. I _like_ quiet, mushy keyboards!

There's a program on atari.archive.umich.edu by Dave Baggett (I think)
that lets you replace the keyclick noise with a sample (in fact, you can
attach different samples to different keys!). You could use a very
short sample and edit it (using SoundLab or something like that;
SoundLab is also on atari.archive) so that it's quiet but still
noticable.

2409. ACSI programming

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-11 04:09:49 UTC
From: erlingh@idt.unit.no
Message-ID: <2qplqd$bgi@ugle.unit.no>
Source record: 32830

For those of you familiar with ACSI programming, you know that it
is only possible to send commands upto 0x31. This is because
the upper 3 bits in the command-byte is used for the ACSI device number.

However, I have heard that there *is* a way to send higher-numbered
commands anyway. This is necessary for some special functions, like
telling a CD-rom to play audio tracks.

The way to do this, is supposedly to send the command number 0x31, then
followed by the "real" scsi command. What I was wondering about,
is one supposed to send a 6 byte command with command number 0x31 and
correct device number and the other 5 bytes cleared. Then immediately
following this, the "real" scsi command in a DATA OUT phase, or ...

Anyone have a clue ?
Anyone have some source code, pseudo code, whatever ?

Erling

2410. gcc + baserel

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-11 08:09:40 UTC
From: erlingh@idt.unit.no
Message-ID: <2qq3s4$g7u@ugle.unit.no>
Source record: 32833

I tried to compile gcc-2.5.8 with -mbaserel and -mpcrel, but got a lot
of errors of the following form:
/a/storlind/home/storlind/b/erlingh/cgcc/lib/gcc-ld:
fatal error: relocation out of range for _yydebug in c-parse.o

So, obviously something has to be patched in order to make this work.
Like de-static-ifying many variables...
Anyone allready done this ?
Patches available where ?

Erling

2411. Re: SCC serial ports (Returned mail???)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-11 08:51:19 UTC
From: leo@ahwau.ahold.nl
Message-ID: <CpMr9L.HA9@ahwau.ahold.nl>
Source record: 32856

I tried to contact you (Ted.Miller@crypt.dswhq.omahug.org) by email,
but 'MAILER-DAEMON@ivgate.omahug.org' returned my posting. Maybe you should
check this out!

In comp.sys.atari.st.tech you write:

>I have a question for all you programming people...

>I know *WHERE* in memory to go to access the SCC chip that controls the serial
>ports in the Megs STe/TT/Falcon. However, I have no idea what VALUES to send
>to the SCC for different things.
There was a pretty good description in the 'Profibuch'. It is however written
in german. I don't know if an english translation is available.

>What I really want to know how to do is to set the SCC so that the port(s) are
>locked at a baud rate of 38400, 57600, and 115200.
It is a rather complicated chip. You have to calculate a divisor value and
put it into write-registers 12 & 13 (if I rember well, I don't have the book
here). But the divisor value is dependent on the clock source. On the atari
are 2 clock frequencies available. There are also multiple pre-divisor values
settable... This means that there is no general answer.

>Any help is appreciated.
I can look somethings up for you but I won't type in all info. It's about
30 or 40 pages in small-print. Maybe you can get the programming manual?
I thought is was a Zilog product.

Regards, Leo.

I've read that the resistor is there to protect your stereo. The F030 sends out
a "phantom-power" of 9V on the microphone input which can damage your stereo.

would you like to buy an Atari STe with 2mb Ram 2 Drives & Mono
Hi res monitor and all my software ..... in imaculate condition for

#400 If you like the idea I think this would be a great system
to start with, when you start storing pro samples you will
probably need a hard disk.

The St's operating system is entirly on chip so to get to your
windows like op sys all you need to do is turn it on with
the Cubase /Beat Disk in the drive .... 2 drives should be
enough if you don't want to store huge 16bit samples.

Reason for selling, I'm buying an Amiga 1200 setup to go with
my Amiga 500.

|> Here is a type error. It should read

|> gcc -v hello.c -o hello.tos lf2cslow

|> of course. However, the linker error is still there ...

The problem is that main() is in a library. On unix, main() is called
directly by crt0.o (the startup module), but on the Atari the startup
module calls _main() which is a function in the C library, and that in
turn calls main(). With f2c, the function main() is in the f2c
library. When the program is linked, the linker first loads the
startup module, then the explicitly mentioned object files. Now it
scans the f2c library. Note that there is still no reference to
main() in the object files. After that the C library is scanned,
resolving the call to _main(). This module also has an undefined
reference to main(), but there is no library left to define it (the
f2c library is already left behind). The fix is to explicitly add
-lgnu (or -lmint) to the command line and after that again -lf2c, that
is the command line looks like this:

gcc -o hello hello.c -lf2c -lmint -lf2c

This should solve your problems.

Maybe it helps to comment out the line

#define YYDEBUG

(or something like this) to leave out the debugging part of the
parser.

If that were the case then I should imagine a capacitor would provide a damn sight more protection against this DC voltage than a resistor would...

Well, it is not only yydebug that has a relocation out of range.
I just included that as an example.
I could mail you some pages of errors from the compilation process with
other variables as well :-(
In fact. A file with only the error-messages from ld is exactly:
141946 bytes....

So, there are some major problems here.

If you were to write a text editor, you'd almost definitely be needing
v_gtext(). Unless you want to go really professional, and do EVERYTHING
using (mostly user-defined) AES objects. But then again, those user
defined AES objects will use v_gtext() to display the text.

TM>a result, some of the other things in the computer aren't exactly right
TM>either, like 50khz MAY be more like 49.99khz, which is totally irrelevant.

There is no timing problem - you are using the wrong values. It was never said
that the sampling rate is 50kHz, it's about 49.something - and that frequency
is generated by dividing the video clock, which is vary stable.

TM>For all practical purposes, the Falcon sound system is wonderful, and any
TM>quirks can be ignored. It's no more buggy than your average Amiga.

The digital part is OK, and the CODEC is ok, too - but the analog electronics
between CODEC and the external connectors is a mess - look in a circuit
diagram and you know what I mean. LM386 and LM387 are not what I would call
the right choice for high-quality audio amplifiers, and things like 'bass
boost' simply do not belong there. Even if you let your dealer remove the
'bass boost' circuitry, the frequency response and noise are not acceptable
for HIFI or harddisk recording purposes.
If you replace the analog parts of the audio circuit with good components,
the sound quality is marvellous (much less background noise, flat frequency
response).
I've heard a DAT player (digitally) connected to a (modified) falcon
yesterday - the playback via the falcon CODEC sounded great.

You mean the Falcon Wings? I have one, it s working fine. It s as fast as 4 Meg s. You cannot put 8 Meg s into it.

> -Are there any expansionboards that make use of the 4Mb already
> installed (don't know of any but if you do)

Not as far as I know.

> problem two:
> Does anyone know about the functionality of the DDD (Digital Data Deicke or
> something like that) 40 Mhz accelerator for the Falcon? A test showed
> increased memory management, but that would mean the memory bus speed would
> have to be increased, but the test doesn't mention it?
> Anybody?

I think they speed up at least parts of the Computer (i.e. some chips), if not the whole bus, up to 20MHz. The Processor is speeded up to 40MHz. This is quite cheap, but also a bit dangerous, don t You think? After all, Motorola writes on the 68030 Chip "16MHz", don t they? Maybe they want to tell us something with that...?

> Or any good info of another accelerator?

I will get the "Mighty Sonic"-Board (hopefully arriving the end of this week). It has a new 68030 33MHz-processor on board and slots for up to 64MByte TT-compatible Fast-Ram. It costs DM 700,-. The thing is, with the Fast-RAM the Falcon will be as fast as a TT, and the RAM-access is said to be even slightly faster than on a TT!

You are using fopen - that invokes the C-library's buffered file routines,
which are slow when transferring big blocks of data.
Use Fopen, Fwrite and Fclose instead - that should solve the problems.

Hi, this is the first time I have subscribed to this group, so forgive me if this question has been posted before, or is in an FAQ.

My ST has exploded, so I bought a 2nd hand STE. 'Trouble is, I have had problems before, plugging old STE's into my Hard Disk, and losing the whole thing.

Can anyone tell me the serial numbers of the dodgy STE DMA chips ?

I want to see if I need a new DMA chip before I plug it in.

Thanx in advance

Basicaly, yes. You might need a program that correctly sets the sound
devices matrix, however. Two publicly available ones are sound through, a
small program which simply links mic input to headphone output (without locking
the sound system) and winrec, which records sounds and uses DSP to add
various effects. Both are available through ftp.

>My microphone is not battery operated and has an on/off switch built in.
yes, htat sounds fine.

2435. HD/DD floppy Problem!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-11 15:52:40 UTC
From: rrice@netnews.upenn.edu
Message-ID: <2qqv08$qei@netnews.upenn.edu>
Source record: 32855

He-e-l-l-l-p!!

I am the proud owner of a Mega STE 4 with TOS 2.06 and an Atari HD floppy conversion kit, which has previously given me no trouble.

I was attempting to do my first hard drive back-up in some time when, on the first disk, I got a "Bad Disk" warning after Diamond Back 2.42 made its usual repeated tries to reformat and recover the data. Every time I put in a new disk, the same thing happened, although Diamond Edge and other disk scanners found nothing wrong with any of the disks I tried.

When I got out of Diamond Back, I found that my HD drive ALWAYS stops formatting on track 45/6 of a DD/DS format and gives me an "DOS Error -16 Message." It can format any HD disk or format without trouble, and scan and read to a DD/DS floppy. It just can't format one--or do whatever it is that Diamond Back does as part of of the back-up procedure. I was able to format and scan all the DD/DS disks involved on my old SF 314 external DD/DS drive.

HELP! Do I have to replace the drive I got with my conversion kit? I tried cleaning the drive with a cleaning disk, and the problem has persisted through that and multiple re-boots.

Any help would be very much appreciated.

As for "mushy" keyboards, there's a kit available that gives the keys a better feel (if you don't like the mushy feel that is). It involves springs or something that you put under each key, and I think it's available from system solutions in the UK. I can check this out if anyone is interested though- I have the info at home.

Oh! I know what you're talking about. A dropped 3! Ok. It's a voiced palatal fricative. French uses J, like in "Je". Also, the Z in "Azure". In english spelling, it's represented by a ZH. We use SH for the voiceless palatal fricative, so we use ZH for the voiced version... makes sence, neh?

Before, I thought you were referring to what is in IPA represented by a g with a horizontal line through it. It's kinda uncommon. It's a voiced version is ch in Bach. A voiced velar fricative.

The Falcon DOES have an MFP. It's just not used for serial I/O any more. All the other functions, including interrupt, and even the Ring Indicator input are still there. It's still used for timing signals in the Falcon. Otherwize every program that used interrupts on the Falcon would break.

For sequencing and nothing else: get an Atari (MegaST with harddisk or
similar setup) they're very cheap and have built-in MIDI ports
and good supporting software.

Motorola has refined their chip-making process so well that when they set out to make a 16mhz part, they really can and do make a 16mhz part. They don't have to design the ship for a higher clock rate and test them for what clock rates the individual chips can handle.

2443. Questions on STe SIMM's

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-12 09:46:00 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2qstso$86c@clss3.bangor.ac.uk>
Source record: 32877

Hello,

I'm about to upgrade the memory in my STe. Looking around there seems
to be SIMMs with parity checking and those without (cheaper ones). Does
the ST care what sort is used ? - Would it use the parity bit if I installed
memory with parity ?

I'm also under the impression that the speed of the memory (say 70 or 80 ns)
has little consequence on the ST.... is this true ?

I'm considering mixing 1Meg and 256K SIMMs and using simmfix to get 2.5Mb
in total. Doing this means that I'll have to boot with simmfix everytime
I switch on the computer, even for commercial games.... has anyone heard
of any problems with this setup - especially with games ?

Thanks for any help,

Dylan

Well Commodore is out of business and Ataris are out of date,
the PC platform is the way to go unless you prefer Macintoshes.......

2448. New Atari programs on HENSAs new baby

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-12 16:00:04 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cpp5py.HID@westminster.ac.uk>
Source record: 32880
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The new HENSA machine is now on-line as an experimental service. Please
log in via telnet, ftp, UK JANET, gopher, World Wide Web on

mic2.hensa.ac.uk

I will be uploading some more software tonight (hopefully another five
packages), so keep an eye out.

I hope you like the revived atari section....I have a lot planned.

If you would like to be put onto our mailing-list, then send a message
to archive-server@micros.hensa.ac.uk, no subject, and body containing
help

You will then get back some help file, telling you how to subscribe.

New software for the Atari TOS section

All files are now in binary format.

New packages are as follows; type "cd ~/micros/atari/tos/<x>/<code>" to get to
where they are held. <code> is as below and <x> is the first letter of <code>.
EG. For package "m100" you'd "cd ~/micros/atari/tos/m/m100".

```
Pfx Date Key Details
--- ---- --- -------
n106 29/04/94 ---- DESKMORF 1.0 3D look to your ST desktop. DEMO, lasts 10 mins
n107 03/05/94 S--- GEMAR 2.20 A SCSI Tape Back Up Program
n085 03/05/94 ---- GZIP 1.2.4 GNU file compression utility
n108 03/05/94 S--- ASSASSIN.SYS 1.0 Ease the process of setting up GDOS
n109 11/05/94 ---- ESS-Code 5.07 GEM'd UUE/UUD program with loads of features
n110 11/05/94 S--- KANDINSKY 1.57e A powerful vector drawing/CAD package
n111 11/05/94 S--- PHOTOCHROME 4.0 Display high colour pictures on your ST
n102 20/04/94 ---- ACCESSORY 1.3 Allows loading of DAs from a folder

>a little bit noisy, but the D/A part is better than many cheap CD players.
>(which cheap CD player has sigma-delta D/A converters with n* oversampling ?)
>(haven't got the Crystal data sheet here at the moment)

Most of the new CD players at the moment use bitstream converters.
But as the Falcon uses data in parallel, sigma/delta is probably as best as
you can get...

You can easily hook up a DAT (or DCC) onto the DSP port and let the DAT
handle the conversion, this should give studio quality results.
(DCC can handle even 18 bit!!)
For most home based applications, the quality of the Falcon will be
adequate. (hey, my TT is sounding great already, and that's just 8 bit)

>>
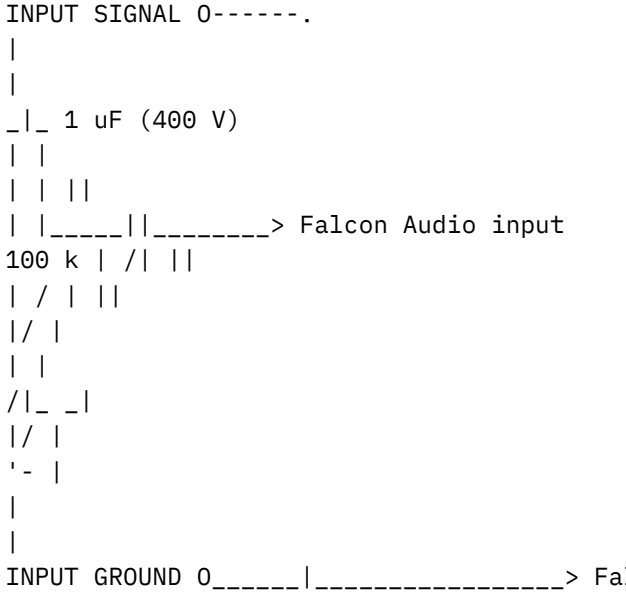
>Phantom indeed!
>I've never heard of this. Very strange.
>
>Anyone got a technical explanation/proof of this ?

Phantom power supplies are used professionally to power up electret microphones so they don't need batteries. However, the voltage on professional studio mixers etc. is about 32 Volt (!) with very little current, so there is no danger when shorting something (or connecting a dynamic microphone..)

The easiest way to prove there is a phantom power source in the Falcon is to connect a resistor (say 1000 ohms or so) across on of the inputs (L or R)and take a multimeter and check it out... If there is still 9 Volts (or a little bit less) then you should always connect a capacitor between the input of the Falcon and you audio source. (capacitor value about 1 uF or so, don't use an electrolytic one)

Easiest way to turn down the input signal is to take a potentiometer and hook it up as a voltage divider:



(I hope I have removed all the TAB's...)

Of course you'll have to use a stereo potmeter to get both channels..

The 100 k potentiometer can handle signals up to wall outlet voltage :-)
But don't try this out!!! It should enable all Falcon users to safely put
in signals from microphone (10 mV) up to HiFi stereo sets headphone output
(approx. 10 Volt pp max)

2455. G++ Library problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-12 23:39:07 UTC
From: pstoaks@spider.mentorg.com
Message-ID: <2quemr$6dk@hpbab.wv.mentorg.com>
Source record: 32885

I just finished a prolonged debugging exercise with G++,
and thought I might be able to save other people the pain.
It is also possible that I am getting my G++ stuff from
the wrong location and that is the source of my problem.

I downloaded G++ from umich.atari.archive, along with the
libraries in gplibs20.zoo and gplibo20.zoo. The library
archive (.olb) didn't contain the iostream.cc module, so
I went ahead and just included that in the link of my program.
This resulted in a memory stomping bug that was extremely
difficult to track down. The version of GDB that is on umich
doesn't seem to work with G++ (I haven't investigated this
in detail yet. If I can make it work I'll let you all
know.) One of our friendly netters pointed me to szadb
which I downloaded from umich (vs. 1.4, I believe) and the
debugging saga began. After maybe 8 hours of learning szadb
and poking around in the guts of my program, I discovered that
the problem was headers and library out of sync. (i.e. the
library objects I had (from gplibo20.zoo) had not been compiled
with the same headers that were in gplibo20.zoo. As a result
my program and the library disagreed on the location of some
virtual functions.)

Recompiling the library from the sources with the headers in
gplibo20.zoo resulted in a library I could use. The bug has
been exterminated. In the process, I was able to put the x*.cc
modules in a separate library, which significantly speeds linking.

I hope this helps others of you who are trying to put together a
G++ environment. C++ is worth the effort.

From: ath@cscns.com
Message-ID: <CpqAMu.4t9@cscns.com>
Source record: 32890

Hi there,

I had a crazy idea; I have an old atari 520ST without a harddrive. I also hav
a 486 w/250 mg harddrive. Is there any way to network the atari to the ibm
for purpose of file storage? I have a fast modem on ibm, and would like to
use that for all internet downloading(Atari files as well).

If anyone has any comments about hardware and software requirements/costs,
please let me know.

I am setting up the Atari for my kids, and would like them to be able to
access files easily(without having to mess with the floppies).

Thanks,

Matthew.

2459. How can I format just a partition?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-13 14:40:02 UTC
From: krieg@point.cs.uwm.edu
Message-ID: <2r03g2INNnvc@uwm.edu>
Source record: 32692

I have a 30 Meg hard drive and I used to devote 10 Meg of it to Spectre (Mac partition). With Spectre, I was able to turn a GEM partition into a Mac partition without having to reformat the whole disk. I have now sold my Spectre and would like to restore that partition as a GEM one. I have an old version of the Supra disk utilities, and I can't find a way to restore the partition without reformatting the entire disk!

I used the partition edit utility to change the partition type from OOP (whatever that is) to GEM, but the other utilities (like Zero out a partition) still do not even recognize the partition. They only recognize the 2 GEM partitions I have.

Is there some way I can do this without reformatting? Backing up my hard drive is a real chore, and I'd like to avoid it if possible. Is there some public domain hard drive utility software I can use instead, which would allow me to format just the Spectre partition?

2462. Falcon RS-232 stuff

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-13 16:07:20 UTC
From: lars-erik.osterud@byte.bbs.no
Message-ID: <768851755.AA05547@byte.bbs.no>
Source record: 32697

I need some help with some RS-232 stuff to get my programs
working on Falcon (the RS-232 routines doesn't work too well):

1) How do I check if the machine is a Falcon (a safe and easy way) ?
2) How do I check the DCD-signal (Data Carrier Detect) on Falcon ?
3) How do I set/clear the DTR-signal (Data Terminal Ready) on Falcon ?

There are no BIOS routines for controlling RS-232 signals on ST/Falcon
so I have used hardware diretly on ST/STE/TT, but now these routines
won't work on the Falcon because of new chipset and hardware-adresses.

Seems, all that discussion is unnecessary now. There's a new revision of the
FALCON motherboard that seems to have VERY big changes in the AD/DA area.
The new Falcons were shown in Berlin last week, as far as I know.

They seem to have line-(rca)-connectors now, too!

Use the ICD format program, and choose partion ahrd drive.
change the oop to gem in the last column. You may have to do this
more than once. I have had to do it up to 3 time to get it to "take".
Every time my son comes home from college I have to dust
off the GCR and change my H partition to a couple of Mac partitions,
both oop and ack, so he can use the tranverter!

FAIK, modulators are available as separate parts. One of the things said to be tossed out when Atari Oz closed down were many NTSC modulators. My best guess is that PAL and NTSC modulators are a drop-in swap. If there is a local Atari dealer or someone with an STm who is not using the modulator, installing a local-standard modulator could be inexpensive and not too difficult. Atari main office should have more informatin on this topic

2469. Falcon for Sale

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-14 13:04:48 UTC
From: davidc@vissci.demon.co.uk
Message-ID: <768920688snz@vissci.demon.co.uk>
Source record: 32729
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok, here goes. A friend of mine (who does not know how to post news)
has the following for sale. If you are interested, then please reply
to

Gordon :
sinigord@cix.compulink.co.uk

1 Atari Falcon Computer (14Mb)
1 Phillips CM8833 monitor
1 528Mb SCSI II Hard Disk (complete with lots of crap on it !)
Joystick, Cables, Box, Instructions, etc....

He also has a 4Mb 65Mb Falcon too. He will deliver to most places
in Scotland and the North of England.

If you are interested, please contact him at the above address,
quoting this article (so he knows what its about !)

Dave.

David Cowan Insert Clever SIG here !

DavidC@Vissci.Demon.Co.UK

My Employer doesn't give a toss what I say,
because he know its mostly Bull !

> and insert over 200 floppies !).

Yes, that's no problem. Run NET s/w on both machines and do a TPUT *.* from
the root or whatever directory structure you want to backup.

I would recommend PE1CHL's NET (I can supply this for both PC and the ST)
but there are others (which I can also supply) for both).

Assuming you're using DIS.EXE on the PC, you can add a SLIP connection to
it on another port, which NET on the Atari will happily talk to at 19k2
(with a 16550 in the PC).

I run 3 machines here (plus others remotely) all networked with this s/w
(mostly over radio links) and it's bombproof....

Mail me if you want more details or s/w.

Cheers, Martin.

Well it looks like CBM is going to rise up from the ashes with a new
ownership. As for sequencing software; a friend of mine is using
Bars'n'Pipes Pro, perhaps not the cheapest, but he thinks it's really
worth the money. It's intuitive and does what he want's it to do.

Sorry I can't tell you more, I do not use sequencers on my Amiga (yet).

Yes, gcc (and g++) for the Atari are freely available.

> Could someone point me to an ftp site where gcc lives?

Look on atari.archive.umich.edu in /atari/Gnustuff/Tos; there are
directories for Gcc, libraries, the binary utilities, gas, etc (sorry I
don't have a complete list of everything you'll need).

Grab, the index for the archive site while you're there, it'll make
finding this stuff easier:

> Also looking for resource editors,

ORCS is probably the best one there; it's shareware, and there's a much
more powerful commercial version called Interface (the ONLY RSC editor
that supports colour icons AFAIK).

> documentation on functions for Atari
> system calls, etc.

Hmm, Tim Oren's ProGEM series will help you do GEM stuff, there's
probably a GEMDOS manual still there... Grab the Compendium (and ask
here about errata!), it'll have much better and more complete info.

> I plan on buying the Atari Compendium (sp?) but I want
> to get a stable compiler first...preferably without spending hundreds of
> dollars on a commercial C package.

GNU C is also the only option you have for developing C++ applications
on the Atari.

The BIOS doesn't provide access to these signals, but there is a
serial port driver package that *does* - take a look at

Utilities/Tosfixes/hsmoda02.lzh

on atari.archive.umich.edu (and elsewhere).

This package contains *fast* serial device drivers for all ST/STe/TT/
Falcon computers, providing functions for setting/clearing/checking
various control lines in a very hardware-independent manner;
not all control functions specified in the documentation are currently
implemented, but controlling DTR and checking the DCD and Ring Indicator
signals should work.
(...at least with the ST-MFP version; I couldn't check the
Falcon-SCC-driver yet!)

I'll try to upload the newest version (HSMODA04, mainly a few bug
fixes) to atari.archive in the next few days.

2478. Internationalizing software

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-15 01:42:30 UTC
From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.y30lyIAR48I@semprini.waterloo-rdp.on.ca>
Source record: 32706

A week or so ago, some people were discussing how to say "Resource file not found!" and "Exit" in different languages.

The point behind this discussion was to have everything in the RSC file for an application so it would be easily to translate it to other languages; the only thing you really need to put into the program is the string for an alert box:

```
+-----------------------+
| /----\ Filename.RSC: |
| |Stop| Resource file |
| \----/ not found! |
| |
| +----+ |
| |Exit| |
| +----+ |
+-----------------------+
```

So, why am I suddenly interested in this? Well, I want to create a class for Warwick's GEM++ class library to handle this in any language. Then it's a no-brainer for anyone building an application using GEM++...

I need to know how an ST/TT/Falcon knows what language it's supposed to use, and I need to know the strings that came up in the discussion; unless, of course, someone else has kept track of all of these and is planning the same sort of thing (ie, releasing some sort of code chunk to handle this).

Ok..sounds to _me_ as if your modem and Falcon are fine..with or without
those conventional programs. IMO it looks as if the problem is not the
Falcon but the system you are trying to upload it onto.

In many instances before login there is a choice between rlogin and telnet,
use rlogin....if I had more specific on how you login and what it is/place/
system you are trying to upload it onto, I might be able to assist you better.

Cheers

2483. Minixfs pl10 ...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-15 15:16:48 UTC
From: shenson@nyx10.cs.du.edu
Message-ID: <2r5ed0$43t@nyx10.cs.du.edu>
Source record: 32740
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings. Minixfs pl10 has just been sent to atari.archive and
ftp.uni-muenster.de . Quiet a lot has been changed. The docs have been
rewritten (well patching stuff onto 0.55 docs wasn't working anymore).
The filesystem format has changed (slightly) see the docs on what to
do.
The Falcon/TT+Multitos problem has been cured! Now the bad news,
the patch only works with MiNT 1.10 and the addroottimeout patch of net-030.
1.10 isn't publically available though if/when 1.11 appears it should have
the net-030 patch as standard.
Please don't mail me saying you can't find Minixfs, it may take a
day or two to be moved to a publicly readable place.
Bug reports welcome (email not usenet) but read the file bugs.doc
before you submit a report.
Donations also welcome of course ...
Have fun, Steve.

What do you mean with 'phantom paower' and '9V'?

If you think of DC voltage, a capacitor would be the right choice.
If you think of AC voltage, ... well this is an INPUT line ...??!?!?!

Does anyone have access to the memory map for the Atari 1040STe? I would like to find out especially where the PIA (or equivalent) ports are located in memory. Thanks for any information. This is very urgent.

-Jerry-

marc horchler <mhorchle@lynx.dac.neu.edu> says:

>KK>I am looking to buy a cheap system for running sequencing (prob. cubase or similar) packages on. It seems to me that an Atari ST or Commodore Amiga are probably my best bet. However, I don't know much about either, as I have always been brought up usin

> Well Commodore is out of business and Ataris are out of date,
>the PC platform is the way to go unless you prefer Macintoshes.......

Well, I'll have to strongly disagree with you. As a PC owner, if you want
a computer to use for musical purposes, your only real choice is a Macintosh.

Maybe this will change in a few years, but I can't count the number of
times I've wanted to buy some product to use with my keyboard and found
out that there wasn't a PC version of it... and since Macs are at least
as good from a price/perfomance point of view, and better from a
usability point of view (at least where musicians are concerned.)

Get a Mac.

I wish I had.

Jay
(Though, I do LOVE running UnixWare on my PC.)

Where can i obtain information on differet memory locations etc for the Atari lie of computers. Could i obtain a FAQ cocerning this somewhere? All help would be appreciated. Also, has anyone who has programmed a MOD Player for the Atari ST on either Hisoft C, GFA Basic system 2.0 or Pascal, email me with source/info/tips at phiga@uhunix.uhcc.hawaii.edu

Thanks in advance!

> The resistor is there to protect your Falcon from line levels that are
> too
> high. It is possible to blow up the input on your Falcon.

Yes! So I've done another thing. I've gone to my local Dealer
and put a variable resistor. I also removed the bass boost on the ouput.

Now I can record with a microphone and a CD (with Line level signal)
without blowing the input. (And the blowing_problem_because_i_forgot_
the_resistor_in_MIC_setting goes away also!)
The necessary changes in the Falcon motherboard are in Cubase Audio. The
only thing we changed is the var-resistor.

Michael Papadopoylos.

But that's half the fun! (the other half is restoring) ;-)

Seriously, one way to go is to hook the two systems up with a
null modem arrangement (easiest way: hook a RS232 cord to each system, and
put a "null modem" (which you can get at Radio shack, etc) between them).
Then load up a terminal program on each side, make sure the settings
are the same, i.e. 19200 baud, etc (possibly load in a RTS/CTS fix on the
Atari) and start a Zmodem transfer. Assuming you have all source files in
one directory and are sending them all to one directory, that is...
(and just sit back and count the bytes :-)

Is there any way to use a QIC-80 tape on an STe?
I really want a tape backup but can't afford a SCSI tape.
Mabee an interface/software combination could be developed
that uses ther cheap DOS tape units. Why not use the second
floppy port and software or an iterface to serial or SCSI
and software??

If this is not possible, WHY????

I got this couple inch long thing from Radio Shack that I use for adjusting the input to the Falcon's mic jack. They said it wasn't for what I'm using it for, but it's just a variable resistor.

I have a hell of a time adjusting the gain and amp levels for getting a decent sound from my electric guitar through the computer. I eventually resported to putting the above variable resistor in between my patch cord and the computer so I had one more adjustment to fool with. It seems that the audio input doesn't like what my guitar give is. Half of the time, it's too quiet, and the other half, I over drive it. Has anyone fooled around with that? Any suggestions?

What would be really nice is if there were some program that would let you play for a while so it could figure out what levels to use, and even an optional dynamic adjust that sorta slowly follows the line levels up and down.

And that bass boost is a PAIN for the electric guitar. I eventually realized that my speakers also had bass boost on, so when I turned that off, it helped, but the lower strings are still louder than the others.

2499. Interface, the RSC editor

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-16 06:24:13 UTC

Interface by Shift, distributed in US by Gribnif Software, is a most impressive product. For those developing programs for the new, colour-packed versions of TOS, this is a Must Have.

Gribnif is currently shipping it without an English manual, because demand has been so high. They will ship the manual to early purchasers when it is ready.

The most impressive part of Interface is the Colour Icon Editor. It is very easy to use, and even imports MS-Windows icons (there are TONNES of them lying around ftp sites).

v_gtext() if I remember correctly.

>Anyway, the question is, Will this work in windows.

Yes it will. As a matter of fact it will work in any place on the
screen on any graphics card and is therefore highly recommended ;-)

>I.e., if i wanted to write a GEM text editor or something ?

Yep. Using v_gtext you can display text in any GDOS font so that is nice
if you e.g. wanted to write in a larger or smaller fontsize. But you
must remember to walk the rectangle list of course and you must remember
that you either only allow non-proportional fonts or calculate the
linelength upfront.

>(DCC can handle even 18 bit!!)

Hmmm, are there already DCC recorders available that have Digital in and outputs? And is DCC acceptable for publishers? Can I e.g. go to a publisher and give them a DCC tape and ask them to press a series of CD's from it? I thought that DCC used compression, which could make it less suitable for professional application in a studio environment.

On a related topic, does anyone know if these SCSI DAT-backup units can also record in the format used for audio DAT-tapes? It seems that these drives would be ideal as a backup system for people using the falcon for HD recording...

>could be inexpensive and not too difficult. Atari main office should
>have more informatin on this topic

Well if the other Ataries are much the same as a later STFM, no way at all,
there are many many parts that have to be changed, these parts have nothing to
do with the modulator..

On a STFM, the modulator only provides the RF signal, for video and sound..

The Video modulator is based on the Motorola MC1377, the video output
of this chip is fed into the RF modulator....

Tell me why would atari Ozz have loads of NTSC bits left..??

Still the cheapest way would to get a Monitor, using a TV is not that good even
for games....

2508. Information on SMS2 please

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-16 12:27:37 UTC
From: D.Corps@herts.ac.uk
Message-ID: <16867-769091245@sirius.herts.ac.uk>
Source record: 32733
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.st.tech,comp.sys.atari.st

Hi,
I've recently seen the adverts and read the STF article about
SMS2, the new operating-system-on-a-cartridge for Atari machines. I am
damn curious about it, and am also wondering why there haven't been any
articles about it on these newsgroups (of course, my feed might be a bit
slow).
I am very excited at the prospect of a proper multitasking O/S
with a proper windowing environment, and although the STF article and
review answered some questions, I have many more. Some of the most
pressing are below, but I would love to see a full discussion of SMS2.
Perhaps a new newsgroup is in order- comp.sys.atari.sms2?
QUESTIONS

What are the applications bundled with SMS2, if any?
What programming languages exist- LBASIC was mentioned, is there
a version of C in the pipeline?
How configurable is it?
How similar to Unix is the multitasking?
Does it support the standard ST/PC disk format (for floppy and
hard drives)?
PD software was mentioned- how much is there, and where could I
get it?
What is it like to use on a 1mb floppy drive system?
How much does it depend on boot disks and the like?
How can it be compatible with STFMs and STEs?

Duncan.

ObCommodore: C= liquidates... how ironic after all these years of
"competition". I hope the Amiga comes back, but I also hope
Atari & Acorn gain a little more credibility from this.

It would surely be possible to use one of the many PC tape units that
connect to the parallel printer port, give that someone would write the
software to do it. This would be a product I would most certainly purchase
or register. Perhaps it could be added to Diamond Back 3 or GEMar. Heck,
even a command line tar-style interface would be fine.

Coming up with a way to use the internal PC tape drives would probably be
much more difficult, requiring hardware and logic (i.e. an interface board),
in addition to software.

SCSI tape drives are not always super expensive. For example, I see an ad
(Spectrum 1-800-959-1030) for guaranteed refurb Wangtek 5150ES QIC-150 drives
for $270, and used deals can be much lower than that on misc.forsale.computers.

>of any problems with this setup - especially with games ?

I wouldn't bother with the extra .5MB because you will have to run simmfix
every time you boot up. The ST may appear to work fine without running it
but IT WILL CRASH :-(If you want more memory than 2MB go for 4MB as I
don't think 3MB will work either. If you stick with 2MB you have to put
the simms in alternate slots as with the 2 256KB simms.

I don't know what you do about games.

Working downloads and buggered uploads usually point to a flow control
problem. Make sure that you have hardware flow control set (RTS/CTS).
Also, it could be that the lack of HSMODEM is your problem, as it fixes
the RTS/CTS bugs in TOS (not sure if they were present on MODEM2 though).
Also, check the configuration of your modem carefully (I think the ATQx
commands relate to flow control, but I am not sure). Hope that helps.

Try using HSMODA02. This works at 57600bps for me onto a 14.4 very nicely.

I don't believe this is possible. It should be with the Falcon (TT?) but
on ST's & STe's {near-quote}'Some of the vital lines are missed off, which
prevents the user from using the parallel port in bidirectional
applications'.

I think it is possible to make a cartridge-port to bi-dir. parallel port
adaptor, using cheap simple logic IC's, e.g. that in Peter Mayer's archive
(ftp.tuwien.ac.at:/pub/atari-st/tuw-tcp/newadapt.img).

Oh dear, following up to my own post. Heres a little memory
jogger, the advert that Furst Ltd. have been putting in the ST press for
the last couple of months.
The advert is (sadly) b/w and 1/4 page, probably they couldn't
afford much more than that. Lets hope SMS2, and Furst Ltd., get the
support they (seem to) deserve.
The text of the advert, excluding the phone number and address
(though I can post them if anyone wants) follows my .sig. And no, I
don't work for them, know them, drink with them, etc. They have simply
developed a product that has caught my interest.

" Duncan P Corps, Student, University Of Hertfordshire "

TRUE MULTITASKING- THE SMS2 OPERATING SYSTEM

the DAWN of a NEW ERA

Furst Limited are pleased to annonuce the launch of a new
operating system for the Atari ST range of computers.
SMS2 turns even the lowliest of STs into a real time system
with workstation capabilities.

SMS2 is an object-oriented, network-ready operating system. It includes
many advanced features such as an intelligent graphics user interface, a
powerful hotkey system, a unique memory sharing system, inter-job
communications (eg. named pipes), re-directable I/O, built-in system
access programs.
SMS2 seems to be unusual in that you simply plug it into the cartridge
port of your ST, switch on and ten seconds later the system is ready for
use. There is no complex installation procedure and yet it is highly
configurable to suit your own particular needs.
SMS2 is supplied on PEROM (Programmable Erasable Read Only Memory) so
that any upgrades to the system software can be recorded onto the PEROMs
enabling your system to be easily updated.

Applications: SMS2 is not GEM or TOS compatible but is a distinct and
separate operating system, which provides a different form of computing.
There are already a number of commercial programs and a good range of PD

software which is available now and is SMS2 compatible.

FURST Limited

SMS2 is ready now for only <GBP>135.00 for the single user version.

There is a review of SMS2 in a recent ST magazine - I think it was the last ST Format.

It does look like an impressive product, but then, many technologically innovative and impressive products are doomed to failure in this modern day, cash orientated world. Sad fact of life... :-(

SMS2 looks interesting, but for me, and many others, we simply cannot afford 160 odd quid on something that is interesting, rather than vital.

Of course, the price has to reflect developement and other costs, I realise that, but it is ultimately down to getting many people owning it, and I don't think that will happen (especially with all the mtasking software flying about at the moment - Mag!X is 60 pounds)

You could try using a null modem cable and use kermit. Not the quickest way, but kermit is free for both the PC and the ST.

>-anybody done it yet ?
>-anything else I should know ?

The SCSI controller of the TT is a 5380 chip, this one can not handle
synchronous data transfers.

So if thats the only SCSI transfer it can make I'm afraid you can't use
that CD-ROM drive with the TT. I'm using a NEC CD210 drive which works just
fine on the TT SCSI port. And yes, you do need a driver. You can use the
freely available Metados drivers or the Mint XFS driver software to handle
the filesystem of the CD-ROM discs (ISO standard).

Maybe you can get the drivers first and ask your reseller if you may try it
out. When using a standard (Macintosh) SCSI cable there will be no harm
done in connecting it to the TT-SCSI port. You just have two options. It
works or it doesn't :-)
Just check the SCSI ID setting of the CD-ROM drive (anything other than 0
or 7 is OK) Depending on the Harddisk driver software you may see if the
CD-ROM drive is responding and returning its ID correctly. AHDI from Atari
is configurable so it checks all the SCSI IDs and shows on screen the
resulting text.

Good luck,
Gert

>less suitable for professional application in a studio environment.

Yep, my DCC300 has a digital in- and output, though it's only coaxial but
ik works like a dream when copying CD's to DCC :-)
This recorder is rather cheap at the moment, Philips is pushing hard these
days. (Fl. 699,- = about $415 !!)

The compression scheme is much better than that of Minidisc and the
extended dynamic range of 18 bit gives it CD quality (Philips claim
that on prerecorded DCC tapes it can outperform CD!)

My (untrained) ears cannot find any difference in the sound of the original
CD and the copy made to DCC (using headphones in a totally quiet room).

>On a related topic, does anyone know if these SCSI DAT-backup units can
>also record in the format used for audio DAT-tapes? It seems that these
>drives would be ideal as a backup system for people using the falcon for
>HD recording...

If you can find (or build) a suitable converter (parallel to serial) it
should be fairly easy to backup computer data onto a standard DAT recorder.
(maybe it even works on DCC) I've been searching already for a suitable
converter chip but so far I ony found a converter chip which converts the
coaxial (or optical) serial input/output into another serial data stream
but with a synchronous clock signal as extra. (I2S system)
On asking at Philips service/development centers the answer I've got was:
Use a DSP to convert the signal into a parallel data stream..... So Falcon
users can do this quite easily. (There is already a box which connects to
the DSP port and which has optical and coaxial in/out connectors!)

I missed the rest of this thread, but it sounds like the answer to my question which is : Can I use IBM 9 bit SIMMS in my STE? Especially the 3 chip versions which are the most common and cheaper than buying 1Mx8 SIMMS here in AUS. Also why do the Atari SIMMS have capacitors on every chip? Since this is not usual do I have to install capacitors if I use non Atari SIMMS? Any information appreciated.

Trevor.

2528. Re: Interface, the RSC editor

Source record: 32757

warwick@cs.uq.oz.au (myself) writes:

>Interface by Shift, distributed in US by Gribnif Software, is a most
>impressive product.

Continuing...

Interface has 3D effects support, for both MultiTOS/AES4.x 3D and for
Geneva 3D.

The only problem I found was that it insists on having the root object
of a form at (0,0). ie. you cannot do my common trick of using the
position of the root window in the RSC file as the default screen
position of the resulting form or form-in-window. Of course, this is
not a very practical technique, anyway (better to position them adaptively
based on the screen size, or save positions to config files).

I'v been using ORCS before, and after pounding my head against all the
fascist things ORCS forces on you, I was glad that Interface allows you
to do anything you want. For example, ORCS won't let you have a form
with "EXIT" set but not "SELECTABLE". Interface will. Interface also
allows you to overlap objects (ORCS complains about "object not within
parent", and you have to fudge it by editing co-ords directly).

Interface saves the entire state if you want it to, so that you can have it
automatically load and open windows on RSC files when it starts up (of course,
under MultiTOS, you can just leave it loaded in while you work on the program
that uses the RSC).

Included with Interface is a pile of code (MyDials) that allows loading
of larger-than-64K-RSCs, colour-on-any-TOS-version, and other great
features. (For me, I use GEM++, so not so useful to me - the code might
be interesting to look at though).

To rate:

MW Resource Editor : 6
ORCS : 7.5
Interface : 9.5

Speaking of a heavily modified Mint 1.10, emacs is running quite well for me because of the patches Erling sent me. Thanks, Erling! Ocassionally, though, I do have a problem with screen redraws; it's tolerable, though.

I was wondering if anyone has problems compiling Mint. The original Mint 1.10 compiled just fine for me, but after I patched it, I had problems with the assembler files. At first, make complained that it couldn't find genmagic and asmtrans, so I ran them from the command line. Then, gcc complained about undefined functions, but they were defined as .globl. Does this sound familiar to anyone? (Sorry I don't have an example error message)

Cheers,

Hi,

I'm looking to get an electronic personal organiser basically to keep a diary, 'phone/address book and take notes/write memos for myself at meetings (a "to-do" list type thing would be handy too). I have recently seen some stuff about the Atari Portfolio but the things I've seen had very few "hard facts" so I was wondering if anyone could send me the specs./tell me what they think of the built in software and stuff like that ? I'm also interested in finding out what extra storage facilities it has and what extra software you can buy.

(A comparison with something like the Psion 3 would be nice as I've used one of them a bit before)

I gather the Portfolio can exchange info with an ST which could be useful as I've got one of those - any further details (on things on software for both platforms please) ?

Thanks in advance for any details - e-mail prefered (as it's a little off subject for c.s.a.s & c.s.a.s.t anyway) but I'm not that fussy !

Cheers,

Martin

>If you think of DC voltage, a capacitor would be the right choice.
>If you think of AC voltage, ... well this is an INPUT line ...??!?!?!

I read this yesterday, and measured it at home. Indeed my Falcon has a 9V DC
phantom power on the input. This could be very useful if you wanted to connect
some active circuitry as an interface to it. I don't really like it (especially
because it isn't documented in the documents I got with my Falcon). It
may explain though why connecting my guitar to it directly creates a
lot of background noise (much more than my microphone).
Now I just made a little connection-box with RCA and jack plugs so I can hook
all kinds of instruments/appliances to both input and output. I guess I have
to include some capacitors there :-(.

[Article crossposted from comp.sys.atari.st]
[Author was Theo Janssen]
[Posted on 17 May 1994 10:10:42 GMT]

Hello world,

After 4 (in words "FOUR") weeks, administration of "ftp.germany.eu.net"
moved my fsp-client for MiNT from the "incoming" to a public accessable
directory. For all those, who sent me E-Mail, sorry for the delay.
You now can get the package using ftp or E-Mail or fsp (PORT 2001) :-) from
"ftp.germany.eu.net" (pub/comp/atari-st/mint/fspclient.tgz)

good luck Theo

Linux 68k is in the works.

As a stop-gap measure you can use MiNT with MiNT-net, the GNU utilities and
my MiNTOS package to get a very good approximation to a BSD-style Unix on
your Falcon which will also allow you to run TOS programs.

Hi.

Is it true that you lose speed in the STFM and the STE if you have > 2Mb?

I recently went from 1 meg to 2.5 meg in an STFM, and did not notice any
difference?

Does anyone have any figures? Would it speed me up by much to go down to 2Mb?

Thanks all.

NO! Only possible configurations are (in Mb): .5, 1, 2, 2.5, 4.
More if using Marpet Xtra-RAM +8.

2 1Mb Simms should only set you back 40-50 UKP!

Hi, I'd like to know what accelerator cards that are available for a 1040STfm.
My motherboard is marked "Rev1.1".

As I am a poor student, I would also like to know what cards give the best
price/performance relationship.

Are there boards that allow SIMM's, and is it OK to keep old (80-120 ns)
SIMM's if the card has cache?

Any answer is appreciated!

David.

Program startup is slower if you have more memory for exeutables which doesn't have the fast bit set. And for TOS 1.4 and later the slowdown is decreased by smarter ROM code.

:Does anyone have any figures? Would it speed me up by much to go down to 2Mb?

Well, for a execuable with the fast bit set you shouldn't notice a thing!

no this is wrong!
The timing is all the same for the memory adressed by the GLUE and MMU chips.
There are some memory expansions available that add some Fast-RAM (TT-like)
above the 4 Mb limit. They are faster.

I have a problem in a game I'm porgramming for the Falcon030. The code is almost ready (99%), and I wil release it as shareware, but I get the following bug during play: After sometime I get a key to repeat endless, bleeping, and sometimes frustrating my porgram. I use the standard trap for keyboard reading. Now can I overcome the problem: a) supervisor mode direct memory reading of the IKBD, b) killing the mouse and/or keyboard (while leaving joysticks on) or c) flushing the IKBD buffer? I use the dsp replayer of BSW, can it be that that's the problem?

Joost.

IL>problem one:
IL>I want to expand my Falcon to pos. 14 Mb using a SIMM expansion board.
IL> -Has anyone had some experience with this? Is it as fast, can i use
IL> 8Mb etc?

There shouldn't be any speed problems. Sometimes programs will work
faster because of the extra memory. As the Falcon has 32bit memory
8mb setup isn't possible (as far as i know).

IL> -Are there any expansionboards that make use of the 4Mb already
IL> installed (don't know of any but if you do)

You can buy any of the accelaration cards that have SIMM expansions.

2549. C++ on a 1040 ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-17 15:44:26 UTC
From: slh100@tower.york.ac.uk
Message-ID: <Pine.3.89.9405171641.A8689-0100000@unix>
Source record: 32780

Hi everyone.

I am getting very jealous of all you b*****ds who are using g++ and all its wonderful, object-oriented features, since I only have a 1040 STE (and no money to upgrade it with), so I have to make do with boring old ANSI C. I find it impossible to believe that a C++ compiler can't be made to work with less than 4 megs of memory, but since I don't particularly feel like writing a compiler myself, I am thinking of having a go at a pre-proccessor to convert C++ code into regular C (like the cfront utility on Unix). Does anyone know if such a program already exists for the Atari? If you happen to have any bits of code (particularly for doing the parsing) lying around, they would be much appreciated.

I haven't yet decided if I'm going to bother with a full implementation of C++ or just some of the more important features (it has become such a monster, it would take a long time to do everything). Any suggesstions? Is there such a thing as an official standard for C++, and if so does anyone know where I can find a copy?

Also, if anyone has any formal specs for C, or feels like trying to explain the difference between K&R C and ANSI C, it would be very useful, since I want to make the thing as portable as possible.

Thanks in advance.

: >The problem was generally present in early STEs.

```
: According to a recent ST Format, Atari have recently repaired the last STE
: from the batch that went out with the Fault DMA chips....

Sorry but mine still has the old chip. BTW these chips are not exactly
*faulty*. They were leftovers from the previous ST series (FM?). When
the STe motherboards were designed, the old DMA chips couldn't handle the
new noise characteristics (or something like that.) Unfortunately that
didn't persuade Atari the recall the machines in the first place.

Having the old DMA chip restricts me to using a floppy only machine until
I get it replaced. I figure replace the DMA chip on a 1040 STe will have
a very low priority as far as Atari is concerned; at least at the moment.
The downside of this is Atari will NOT send me the replacement chip I need
so I can get it put in here and I really don't feel like not having my
machine while Atari 'gets around to it.'

+-- This was written in a previous article by Peter Lord...
|> Will I buy it? Yes if the GUI was based on X11 (to make porting PD apps
|> easy) and it runs older TOS based programs (GEM would be even better).

The ST Format article does make passing mention of Unix programs
having been ported, but does not go into detail on the similarities/
differences between SMS2 and Unix. I doubt SMS2 could handle multiple
users and keep its promise re: speed.
I doubt old TOS stuff could run... but raw 68000 code might. It
depends on what traps do what (Duncan shows how limited his knowledge of
68000 and TOS is), I expect.

|> But as far as I can make out, its a completly now OS with no backward
|> compatability nor compatable with other OS's.

No great loss, if existing Unix software can be recompiled for
it. There has been mention of a C compiler, this seems to be a good step
forward. As long as authors use the O/S and the GUI correctly, SMS2 does
have similar facilities to Unix, and the compiler uses ANSI C, then SMS2
could well have a very bright future.
As for the other multitasking O/S... as I understand it, those
require a hard drive and are essentially similar to GEM/ TOS. Since SMS2
is cartridge based and does not appear to require anything more than a
floppy drive, this gives it a convenience I find very attractive.
Also, I've always found GEM to be a little limited as an
interface. This is probably why so much software ignores it. It is
simple and fairly intuitive, but it also seems a little clumsy and not
very 'open'.
If SMS2 is as easy to use as it seems, then an ST equipped with
SMS2 should have no trouble getting software. The problem is whether
someone will look and see the ST, a old architecture on the decline, or
SMS2, a powerful new top quality O/S. Linux is giving the PC a tad more
credibility, isn't it?

Duncan.

>Hi, I'd like to know what accelerator cards that are available for a 1040STfm.
>My motherboard is marked "Rev1.1".

T28/T36 are 68000 cards running at 28/36 MHz respectively.
Also there is something called the PAK/030 or something, the details of
which I know not, apart from it can go up to 50MHz with a 68030!
Expensive though.

T28 goes for about 200 UK pounds.

Let me quote Mr. Spock: "That is not logical!"

Since (voltage!=current) I thought DV as in "Direct Voltage" would be more
appropriate, but what do I know? English is not my native language.

BTW: You missed the smiley in my orginal post, didn't you?

FWIK SMS2 is an implementation of the Sinclair QL O/S. Much of what I've
read about it has been in 'QL World' magazine.

Assuming this is the case (and flame if I'm mixed up somewhere ;-)

> What programming languages exist- LBASIC was mentioned, is there
>a version of C in the pipeline?

There is a fairly good C compiler for the QL, but nothing that gets
anywhere close to GNU C or Lattice C

> How similar to Unix is the multitasking?

Not particularly. MiNT is closer IMHO

> Does it support the standard ST/PC disk format (for floppy and

I believe so, although I don't think this is the standard.

> PD software was mentioned- how much is there, and where could I

Well I assume they mean the *vast* quantity of QL PD ;-) There is not
really a lot out there.

> What is it like to use on a 1mb floppy drive system?

Should be very good. Its a lot more compact than TOS.

IMHO don't bother. I've had a bit of experience of standard QL QDOS
(which as I said I *believe* SMS2 to be an enchanced port off, and in most
ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
be its compactness and efficiency.

:-)

Roland.

In GFA just PEEK (is supervisor mode) $5a0 for the address of the jar and
then each cookie is exactly 2 longwords, the first is its name the second
in a value. It's fairly easy. HiSoft BASIC has a GETCOOKIE call but you
could easily write one in GFA.

CFront *is* the C++ compiler on most unix Machines. It is not just a
preprocessor.

The best approach for those with anything less than a 4M Falcon (and even
some of those), is to build a cross-compiler on an accessible Unix machine,
do all the compiling there, and transfer the binaries back to their Atari.

Binary `diff' and `patch' programs would help this greatly.

It's easy from Hisoft Basic (GETCOOKIE function). Even in another language
it's only a matter of reading a couple of longwords from memory.
You definitely should use the cookie jar to check hardware details.

From: lezo@central.susx.ac.uk
Message-ID: <2rchqr$j25@infa.central.susx.ac.uk>
Source record: 32537

I have just acquired a HP 550C Colour Injet and I would like to 'use' one of the printer driver <ESCape> sequences in First WordPlus such that I can print some strings of ASCII text in colour, eg. by mapping 'red' print onto and in place of the normal italics command.

Snag is, without the [extra] technical printer manual I can not make head nor tail of the 'Raster planes' printer commands which are only referenced but not described in any great detail in the user manual.

Could someone give me a clue as to how I structure my ESCape sequences to do this?

(By the way, I have no problem with printing colour 'images' as I use the EXCELLENT package ImageCopy 2 which is supplied by the FaST Club.)

Thanks

Lez

Perhaps others can give a btter sugestion, but the best I think you can get at the moment is a MiNT system with one of the shells (tcsh,bash) and the gnu utils. You can get alot of Mint freindly ports of stuff like flex, gcc, bison, yacc, and so on. Until (if ever!) we get a Linux port this is the best you can do to get a Unix like environment. I think,...anyone wish to add/flame this?

|> There is a review of SMS2 in a recent ST magazine - I think it was the
|> last ST Format.

Yes, I know, and though it told me enough to get more interested
in SMS2 than in the disk based O/Ss, it left me with a lot of questions,
which is why I started this thread. Since then I've got a lot of info. from
the articles you have posted here, I've got more info.
But I've also found out about a *very* good article in the
upcoming June issue of ST Applications. You can get details of STA from
ST Club in Nottingham, phone 0602-455250 or fax 0602-455305. I don't
know how to call them from abroad, I've never been abroad and wanted to
phone someone in England before.
Lordy, all this makes me sound like a complete SMS2/ STA
advocate. I don't work for them or anything, I just like them. This is
not a sneaky attempt to stir up interest artificially, they deserve all
the interest they can get, IMHO.

Duncan (75% certain to save up and buy SMS2)

PS. I wonder if not supporting TOS disks is really a mistake... Perhaps
some kind soul could write ST File Exchange, or summat?

The Falcon can be connected to SM124 (monochrome only :-) , SC1224 or any other
RGB monitor and, of course, VGA (best).
You can also use the Falcon built-in TV modulator to connect in to a TV, but
the display quality is rather bad.

There are three monitor adaptors for the Falcon:
1. Old 13 pin ST adator (for Atari monitors)
2. Composite adaptor (for RGB monitors with composite signal input)
3. VGA adaptor (9 pin)

bye,
Chris

Chris,

-> I need to know how an ST/TT/Falcon knows what language it's supposed
-> to use, and I need to know the strings that came up in the
-> discussion; unless, of course, someone else has kept track of all of
-> these and is planning the same sort of thing (ie, releasing some sort
-> of code chunk to handle this).

We have pleaded for a long time for the introduction of an cookie
called _LNG (or something similar) to facilitate and standarize the
detection of the system's 'language' or country code. Apparently, the
newer OS versions support something like that with the _AKP (advanced
keyboard processor) cookie. The high word of this cookie is reserved,
the low word indicates the language currently used for keyboard
interpretation and alerts.

Fortunately enough, there is now also the _IDT cookie to give you a hint
about the date and time formats to be used. If you cannot locate the
_AKP cookie (or any cookies), the country code has to be extracted
from the OS header.

First, get the contents of the system variable _sysbase ($4F2),
then get the word at (_sysbase)+$1c. This word is called os_conf
and contains in bit 0 whether this is a NTSC (bit 0=0) or PAL
(bit 0=1) machine. The next bits finally contain the country code.

The country codes: 0=USA,1=Germany,2=France,3=UK,4=Spain,5=Italy,
6=Sweden,7=Switzerland (F),8=Switzerland (G),9=Turkey,10=Finland,
11=Norway,12=Denmark,13=Saudi Arabia,14=Holland,15=Czechoslovakia (it's
a bit dated alright),16=Hungary,127=all countries (as of TOS 4.0 the OS
contains multiple languages and switches to the correct one).

Ralf.

2581. Falcon DSP MODPLAY Library (Basic & Assembler)

Newsgroup: comp.sys.atari.st.tech

From: Craig.Graham@newcastle.ac.uk
Message-ID: <Cq05ty.AsJ@newcastle.ac.uk>
Source record: 32560

I've just finished adapting the DSP MODPLAY routines by Bitmaster into
a simple to use library for devpac of HiSoft Basic2. Mods play as a background
task, there's very little CPU overhead at all. Source for the library is included
(you need Devpac 2 to assemble it), so is a binary, ready for inclusion in
HBASIC.LIB. Instructions & example code come with it - now there is no excuse for
lame sounds ever.....

Example (Basic)

```
LIBRARY "MODPLAY"

DIM mod%(70000), dummy%(1)

InitMod dummy%()

l&=varptr(mod%(0))
bload "mymod.mod",l& 'Load the modfile

PlayMod mod%() 'Set it playing

GetModName mod%(),name$ 'Get it's name into name$
Print"Now playing:";name$ 'Print out the name (note that the mod is
' playing now)

DO WHILE INKEY$="":LOOP 'Wait around for a while

StopMod mod%() 'Turn off the mod

END 'The end.
```

The assembler version comes with the same commands but as a set of macros.....

I'll upload to ftp.uni-kl.de after the weekend.

From: ral@bnr.co.uk
Message-ID: <ral-180594144537@bharm1ca.bnr.co.uk>
Source record: 32557

I've an early Atari STFM. I bought an external DSDD floppy, but
I can't make the machine boot from it.

Is there some teeny memory patch I can do?

or

Is there some software to persuade the machine to boot from floppy B?

or

Is it impossible?

Thanks in advance.

Please reply via e-mail direct, i.e. A.H.Bolle@bnr.co.uk

Yes, in hardware. The point is though, if you're running a program from cold
that doesn't have the fast bit set, TOS will allocate all free RAM to the
program AND THEN CLEAR IT. With 4Mb, clearing all RAM takes some time, like
3-10 seconds depending on the routine. In this case however I don't think
it's an issue, you probably won't be able to notice the difference is speed
between a 2Mb and a 2.5Mb machine.

>>: I wouldn't bother with the extra .5MB because you will have to run simmfix
>>: every time you boot up. The ST may appear to work fine without running it

Only on a cold boot (power on or Ctrl-Alt-Shift-Del, or on a bad crash) Once
set, TOS retains memory setting across reboots. The thing to do is have a
disk with JUST simmfix in the AUTO folder, and boot with this, then remove
the disk, stick in the disk you really wanted to boot from, and press reset.
This works for games too (as long as they don't mind being run in >.5Mb
anyway - the ones that don't are thankfully far and few between, and there
are alternative fixes for them.)

>>: but IT WILL CRASH :-(If you want more memory than 2MB go for 4MB as I
Most horrendously. But only if you actually use more than 1.9Mb.

>>: don't think 3MB will work either. If you stick with 2MB you have to put
??. You can't get an extra 1Mb in a 2 SIMM combination. Only .5Mb and 2Mb.
On 1Mb machines, you have 4 .25Mb SIMMs.

>>I have never heard of problems with 2.5 Mb, and the .5 Mb IS very nice to
>>have. Imagine the difference between a 520 and a 1040, and you see how
You can have you're 2Mb as before, with a floppy sized RAM disk on top!

>and 3 of 256KB). I'm only a poor student and I can't afford to buy 2 SIMMS
>of 1MB at once.
Absolutely not. Wont work. (I think, if you tried it, TOS would interpret
them as all being 256K)

According to ST Format a couple of years ago, this had been done a LONG time
ago, by recalling all faulty chips. According to discussions on here and
other groups, no such effort had been made at all, but it was publicised
that there had been (great PR work Atari!), although anyone complaining got
a free set of replacement chips.

Well an initial version of the TCPIP Faq (if you can really call it that)
how about the Guide to Connecting your Atari to the Internet. At least a litle
more accurate. ;) Well after some small amount of research and work I have
come up with an initial version. I am certain that it does not contain
everything it should, but I wanted to get it out for comments and suggestions.
The current version is approx. 45K, I am going to send it to a.a.u.e.,
ftp.uni-kl.de, mic2.hensa.ac.uk and ftp.tu-clausthal.de. If you are unable to
FTP then send me email and I will mail it to you.

Please feel free to make comments and suggestions. And pass it on to
anyone who needs it.

>PS. I wonder if not supporting TOS disks is really a mistake... Perhaps
> some kind soul could write ST File Exchange, or summat?

Well depending on how comapatible SMS2 is with QDOS - there is already at least one good ST/PC disk reader for it.

Anyway IMHO ST/PC disk compatibilty is a must, if only as a way of getting source code files on for recompilation. The underlying file system can be something else - however FWIK, the QDOS one is pretty poor comapared to MINIXFS or even TOSFS.

>CFront *is* the C++ compiler on most unix Machines. It is not just a
>preprocessor.

Clarification: Cfront produces C code, which is then compiled and assembled
to produce object code. This does not make Cfront a pre-processor for C any
more than a standard C compiler is a preprocessor for Assembly language.
(most C compilers take C code as input and produce Assembly Language as
output).

There also exist Modula-2 compilers that produce C as intermeditae code.

And Pascal compilers.

And Fortran compilers.

p2c and f2c are not `preprocessors for C'. Nor are they trivial to implement.

Source record: 32575

schwab@ls5.informatik.uni-dortmund.de (Andreas Schwab) writes:

>... CFront *is* a C++-to-C preprocessor, as the name implies.

Here are the reasons why Cfront (the C++ compiler) is not to
be considered a C preprocessor, wherease CPP (the C preprocessor) is
to be considered a preprocessor:

1. If Cfront produces C code that does not compile,
that is an error in the Cfront compiler.
CPP regularly produces C code that does not compiler.

2. Cfront is not obliged to produce portable C code.
And it doesn't. Not in the slightest.
Code from CPP is expected to be as portable as the
original sources (including headers).

3. Cfront can produce arbitrary identifiers in the
C code (ever seen a mangled name?)
CPP is obliged to preserve as much of the code
structure and text as possible.

See the difference?

If you want to label Cfront, it is a Front End that accepts C++ as input.
The CC compiler is ACPP + Cfront + Cback. Cback = plain C compiler.
ACPP = the C++ preprocessor (just like CPP, the C preprocessor).

Anyway... back to your regular programming.

Want to know more? Subscribe to comp.lang.c++, but please don't say
that Cfront is a preprocessor for C, or else the resulting flames will
bloat that newsgroup beyond even the ridiculous proportions it has
already grown to.

Message-ID: <2rem8s$eec@news.dmpe.CSIRO.AU>
Source record: 32613

Hi y'all

At the moment I am trying to implement an ASM routine in one of my programs to direct screen writes. (No the VDI is NOT fast enough thank you.) I have a vague idea of how to do the procedure, but how the hell do I implement it in GNU C!? And how does GNU store the 68k mnenomics!?

Currently I think something like:

```
void screenwrite(int x, int y, int col)
{
asm("
moveq 0, d0
movel x, d1,
movel y, d2
movel ....
")
:""
:""
}
```

So how do I do it!? And how do I pass the variables into registers!?

Many Thanks,

Karl.

2597. Compiling (under) MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 07:07:52 UTC
From: huveneer@math.ruu.nl
Message-ID: <1994May19.070752.13352@cc.ruu.nl>
Source record: 32578

Hi,

I have some questions using gcc and Mint on a Mega Ste:

a) When compiling mint 1.10, I must decide wether I want memory protection or not.
I think I have to turn this off, because the Mega Ste is not capable of
memory protection, but I am not sure.

b) Is it true that virtually any program running under BSD unix can be compiled under
MiNT using gcc?
Which extra options do I have to pass to gcc? I think -mint and -mshort.
What happens when I omit -mshort?

c) How do I compile a program to be shareable? Can I do this with any program?

Wow, what an amount of questions!

By the way, has somebody written a BSD like 'ps' for MiNT, accepting standard options
like -ux and so on. Otherwise this will be the first thing I'm going to do.

Please help me with some of these questions.

Richard.

I just did some cookie stuff in Heat 'n Serve C this week, and will try some cookie checking in Power Basic this weekend. It is not that difficult. It is just that one needs to go into supervisor mode once to get some address, but for the rest it is just a matter of 'peeks' and 'pokes' so to say.

If anyone wants a simple example, I think I can write one from the source I have now.

Erlend.

It doesn't really matter as MiNT when it boots will discover that your STE
can't handle memory protection so won't bother.

>b) Is it true that virtually any program running under BSD unix can be compiled under
> MiNT using gcc?

Yes, with a few reservations such as fork() blocks the parent process until
either the child exits of execs a new program over itself. Oh, and there are
a few missing routines in the library, but the list is getting shorter all
the time.

> Which extra options do I have to pass to gcc? I think -mint and -mshort.
> What happens when I omit -mshort?

Best not give -mshort unless you know that the programmer who wrote the
program didn't use the assumption that int == long == pointer.

It depends upon whether you are using the MiNT-libs as your default
libraries or not. If you are then there is no need, just use MINT as a
preprocessor symbol (ie -DMINT) and use MINT in your #ifdef's when you port
things.

>c) How do I compile a program to be shareable? Can I do this with any program?

(i) Make sure you have the sharable versions of the MiNT libs in /usr/lib
(or where ever you have your libs) and compile with the -mbaserel
-mpcrel flags.
(ii) Many programs won't link properly as some the references become greater
than +/-32K.

>Wow, what an amount of questions!
>
>By the way, has somebody written a BSD like 'ps' for MiNT, accepting standard options
>like -ux and so on. Otherwise this will be the first thing I'm going to do.

People have tried.. I think someone is still working on one.

>Please help me with some of these questions.
>
>Richard.

2600. SCSI acces on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 10:36:15 UTC
From: bernard@claudia
Message-ID: <2rffev$g9f@serveur.cribx1.u-bordeaux.fr>
Source record: 32580

Hi everybody,
I would have like to know how to program the NCR chip on the Falcon.
I planning to make the linux kernel work on falcon (it already boots on a ramdisk).
But now, to go to the hard stuff, I need to make some hd driver.
In the source of the ibm kernel there already is a generic driver for the NCR SCSI chip
but I can't find the adresses to use for accessing this chip.
Does anybody know about this stuff ?

Thanks in advance.

S. Bernard

2601. DMA interface on 1040 ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 11:09:35 UTC
From: S_FITCH@open.ac.uk
Message-ID: <S_FITCH.5.000B293E@open.ac.uk>
Source record: 32588

Can someone post details of the 1040ST DMA interface ?

Specifically what sort of disk controller/hard disk combinations are compatible with this device?

Steve

2602. >>Falcon Monitors

Maybe a 9 pin adaptor exist, but when I bought my Falcon I got a
15 pin VGA adaptor.

So long,

2603. MiNT 1.10 problem--login

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 11:56:09 UTC
From: Geoffrey Spear <gspear+@CMU.EDU>
Message-ID: <AhqpDNy00WB=4MUxJd@andrew.cmu.edu>
Source record: 32589

i just compiled MiNT 1.10 (with the net-030 patch), and when i boot the machine, i get a login prompt fine. however, the machine doesn't respond to anything i type at the prompt (doesn't echo and doesn't accept input without echoing it) except ^C, which results in another login prompt. has anyone else had this problem, and if so, how did you fix it?

geoff spear |please reply via snail mail,

I have the following problem in a game I'm coding for the Falcon030: After a while I get a sudden repeating key. I use a trap to read the keyboard while playing, and use BSW DSP modplayer. Does anybody know the correct solution?

PLease mail me at Joost.vanderleij@phil.ruu.nl

Joost.

2605. High res TTmonitor for low cost

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 12:20:06 UTC
From: dba@jet.uk
Message-ID: <1994May19.122006.12971@jet.uk>
Source record: 32585

Hi
The following Info may be of some interest to other TT owners. I have just bought a brand new 15 inch monitor which cost just pounds 27.99 + VAT.

It,s a Princeton Model LM-301 the spec is:
max resolution 1664(h) x 1200(v)
video 160MHz 4shades
CRT 15 inch,110 Degree landscape mounted
Phosphor white(p188)
Horiz freq 74.63KHZ
Vert freq 60HZ non-interlaced
The video is of course ECL which matches the output of the atari TT.

The supplier was:
BULL Electrical
250 Portland Road
Hove
BN3 5QT

Tel 0273 203500

A few internal adjustments have to be made so that the display is stable but that only requires a small insulated screw driver. All the adjustment points are readily availiable and the display can be adjusted over the whole of the screen area.

monitor 9 pin D conector Atari TT 15 pin HD D conector
ECL MSB - pin 1 -------- connected to -------- pin 4
ECL LSB* - pin 2 -- connect in parallel with -- pin 15
ECL LSB - pin 3 -- connect in parallel with -- pin 4
-5.2v - pin 4
H Sync - pin 5 -------- connected to -------- pin 13
ECL MSB* - pin 6 -------- connected to -------- pin 15
ground - pin 7 ------------------------------ pin 5
ground - pin 8
V Sync - pin 9 -------- connected to -------- pin 14
pin 9 / connect to pin 10
pin 10 / connect to pin 9

The high density connector is availiable from Maplins.
Part Number JW77J and a trimming tool Part Number BR49D

Has anybody got the full specification for the TT video signals? The service manual does not have the technical spec.

regards

2606. Atari CD-ROMs FAQ (Beta version)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 12:22:15 UTC
From: brarda@vxclia.cern.ch
Message-ID: <Cq1uD3.C5I@news.cern.ch>
Source record: 32584

This is the first release of the Atari CD-ROM FAQ. It is like a beta
version with probably a lot of mistakes.
Feel free to mail me for all the errors you see (in the contents and also
in the form because I am French and the English language if no my first
one) or for other information that can be interesting.

Loic

ATARI CD-ROM FAQ
----

1 - What driver should I use with my Atari system ?

There are several drivers available :

MetaDos :
Free software from Atari Corp.
Available from atari.archive.umich or ftp.muenster.de (metads23.zip)

The filesystem drivers support ISO9660 and High Sierra CDs, but not
multisession CDs.
The device driver only works for the Atari CDAR504 connected to the
ACSI bus or with generic SCSI CD-ROMs connected to the TT SCSI port.
(Answer from Julian Reschke)

CDROM.XFS :
Free software (Copyright 1992,1993,1994 Eric R. Smith, Michael Bernards
u. Gunther Leis)
Available from atari.archive.umich and other ftp sites.

This driver is a Mint extended filesystem and works on TTs and Falcons.
CDROM.XFS version <0.7 does not work with Mint/Multitos > 1.04.
The current version (0.7) is said to work on Mnt/Multitos > 1.04.
It seems to be true on TTs but it does not work with any Mint version
on my Falcon.

CD-Tools :
Commercial solution from Hard & Soft, Obere Muensterstrasse 33-35,
D-44575 Castrop-Rauxel, Germany, Phone: ++49 2305 18014, Fax: ++49 2305
32463

Includes MetaDOS with GEM-based installation program, audio player with
PCM audio data import (only some drives) and custom devices and
filesystem drivers (support for Atari CDAR504 and generic CD-ROMs
connected to ACSI through host adapter, TT-SCSI, Falcon-SCSI,
multisession support (only some drives)).

(Answer from Julian Reschke)

With CD-Tools, you also have a GDPS module and the program Scan-It that can handle Photo-CD Pictures.
CD-Tools is in German and costs 99 DM.

ExtenDOS v1.1:
Commercial solution from Anodyne Software, 6 Cobbler Court, Ottawa, Ontario K1V 0B8, Canada.

Support ST, STe, Mega, TT, and Falcon. Read ISO9660 CD-ROMs. Run under TOS normally and under Multitos as long as memory protection is turned off but it is impossible to run programs directly from a CD under Multitos.
Extendos v1.1 costs $19.95.

ICD Pro :
Old versions came with a MetaDOS driver named ICDCDROM.BOS.
The new ones comes with a mint extended filesystem.

2 - What discs are available ?

There is three Atari specific CD-ROMs :

GEMini CD-ROM :
From Walnut Creek CDROM, Suite 260, 1547 Palos Verdes Mall, Walnut Creek, C 94596, USA, Phone: +1 510 674-0783, Fax: +1 510 674-0821, Email: info@cdrom.com, Ftp: ftp.cdrom.com
Available in Germany from Ingenieurburo Praefcke, Holtzvogtkamp 55, 24220 Flintbeck, Phone: (04347) 7531.

You can find the index of the GEMini CD-ROM on atari.archive.umich.edu.

Bernd Lohrum CD-ROM :
From Bernd Lohrum, Schlossbergstrasse 36, D-66440 Blieskastel, Germany, Phone: (0171) 4210222

This CD-ROM costs 69 DM (59 DM for MAUS net users).

Wohlfahrtstatter CD-ROM :
From Wohlfahrtstatter, Irenenstr. 76c, D-40468 Dusseldorf, Germany, Phone: (0211)429876.
This CD-ROM costs 89 DM.

You can also use all the ISO-9660 CDs that exists for the PCs. You won't run the PC programs but you will access all the text, pictures, and sound files on it.
The discs already tried are :

Corel Artshow 91 :
~ 1000 scans of paintings (like Manet, Van Gogh, ...) in 16 and 256 colors PCX files;
All the images from the 91 Corel draw contest in CDR and DIB format;
some midi files.

The PCX and DIB files can be read with Dieter Fiebelkorn's Gem-View 3.xx .

Clipart Warehouse

3 - Can I use Photo-CD on my Atari ?

Of course You can !
To have full use of the photo-cds, you'll need a multi-sessions drive and driver and also a program that can handle PCD files.

CD-TOOLS :
The driver from Hard & Soft can read multi-sessions discs and have all the needed stuff to handle the Photo-CDs.

ColorDiscPCD :
Commercial software from Color Concept, Im Alten Breidt 4, D-53797 Lohmar Breidt, Germany, Phone: (02246) 7132

This program allows you to manipulate the photos on your Photo-CDs, and save them on hard-disc. It handles Portfolio CDs.
If my understanding is good, it works with metados and a special BOS file (both included).
It also includes a CD-Audio player.

ColorDisc PCD works on TTs and Falcons and costs 99 DM.

Studio Photo :
Commercial software from Eurosoft.
This french program can manipulate Photo-CDs.

4 - Can I play Audio-CDs on my Atari ?

Of course You can !

The following programs are available :

CD-TOOLS :
The driver from Hard & Soft includes a player for CD-Audio discs. The drive must understand SCSI2 instructions.

ColorDisc PCD :
It also includes an audio Player.

Audio CD Master 3.0 :
Commercial software from It's All Relative Software, 2233 Keeven Lane, Florissant, MO 63031, USA.

This program can play CD-Audio discs on SCSI2 and Nec drives. On falcon and with some drives, it allows you to control and pipe your CD audio sound into the Falcon for DSP effects using software like the Audio Fun Machine that comes with your Falcon 030.

Audio CD Master 3.0 costs $29.99 US, postpaid, worldwide.

Audio CD player 2.0 :
Older shareware version of Audio CD Master 3.0 from Nina Montaser, P.O. Box 52127, Ottawa, Ont. K1N 5S0, Canada

Does not work on my flcon.

5 - Appendix A

These are some users configurations :

TT, MultiTOS 1.04, CDROM.XFS
TT, MultiTOS 1.08/9, CDROM.XFS v.0.7
TT, MetaDOS

These do not work:

TT, MultiTOS 1.08/9, CDROM.XFS < 0.7
TT, MultiTOS, MetaDOS

Drive : NEC Multispin, external (84-1).

Discs : GEMini Atari CD ROM from Walnut Creek
Clipart Warehouse

MSTE -> ICD MicroSCSI -> ICD AdSCSI+ -> NEC CDR-37
but the first host adapter in the chain has nothing to do with driving the CD-ROM, its for a hard disk. The AdSCSI+ also has a hard disk running from it as well as the CD-ROM

Drive : NEC CDR-37

Software :

ICDCDZ2.XFS as supplied on the ICD Pro utilities disk. This only seems to work under MiNT <= 1.04. None of the other freely available CD-ROM drivers (MetaDOS etc.) seem to work. I haven't tried Extendos or CD-Tools.

For audio playing, I'm using Nima Montasser's 'Audio CD Master 3v0'. This is the commercial release of the AUD_CD20.ACC audio CD player. Both work fairly well for me, but I haven't got all the features to work yet.

In order to CD Player configuration to work (the default NEC CDR-37 one didn't work! with AUD_CD20.ACC) I contacted NEC(UK). They very kindly sent me a copy of their 'SCSI 1 Spec' free of charge. This is a 90 page photocopied document which lists all the SCSI 1 commands for a CD-ROM and what they do. I'm sure its pretty outof date now, especially as NEC must be onto SCSI 2 by now.
I used the SCSI.PRG from the ICD Pro disk to send SCSI commands to the CD-ROM to get the combination right.

Atari Falcon030, 4MB RAM, 127MB Internal IDE drive, 270MB external SCSI drive, Viper 105S Tape Streamer.

Drive : NEC 2xi

Non-working drivers: MetaDOS 2.3 (no BOS drivers for Falcon).
ICD Pro Utilities (didn't see the drive at all).
Atari CDROM driver, v0.6 (gave read errors).

Working drivers : ExtenDOS v1.11 (commercial, available in the UK from
Systems Solutions, price about 30 pounds).

Discs : Gemini Atari CD-ROM.
Cover disk from a PC CD-ROM magazine. The files read OK, but obviously
the PC-specific executables do not run. I got loads of TIF pictures etc
off of this disk.
The NEC 2xi is about the same price as an Apple CD300 (160 pounds + VAT).
But people seem to have had less hassle getting the Apple drive running.
I chose the NEC because is an internal drive, so slotted into my
mini-tower comfortably.

Thanks to all the users that mailed me their experience.

2607. 520ST with VGA monitor - how ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-19 12:24:49 UTC
From: Craig.Robertson@newcastle.ac.uk
Message-ID: <Cq1uHE.2Mu@newcastle.ac.uk>
Source record: 32587

I've got a left-over VGA mono monitor (Samsung ML4571 @ 50Hz) and a sad old 520ST. How can I make the latter work with the former ?
I was going to buy a new mono monitor but they all seem to be hacked VGA's anyway.
I know that the output from the ST is a different frequency, perhaps someone knows of a kit/ box of tricks to do the necessary ?

Cheers,
Craig.

: S. Bernard

The NCR5380 registers are selected by writing a word to address $FFFF8606,
The LSB of the word is as follows :

Word Value NCR Register.
$88 0 Read = Current SCSI Data Bus value
Write = Output on SCSI Data Bus
$89 1 R/W Initiator Command Register.
$8A 2 R/W Mode Register.
$8B 3 R/W Target Command Register.
$8C 4 Read = Current SCSI Bus Status
Write = Select Enable Register.
$8D 5 Read = Bus & Status Register.
$18D 5 Write = Start DMA Send. (Bit 8 set for Write DMA mode)
$8E 6 Read = Input Data Register.
Write = Start DMA Target Receive.
$8F 7 Read = Reset Parity / Interrupts.
Write = Start DMA Initiator Receive.

Once the NCR register is selected, Reading or Writing to the register is
acheived by a Word sized R/W operation on Address $FFFF8604.
DMA operations are handled in the same manner as floppy drives.

> floptical drive be hooked up to a STacy?
>
> Anything that I might need to know about them would be helpful!

Have you tried a floptical yet? They are IMHO fairly useless. Extremely slow, picky about software (only ICD Pro level or Link software supports them), etc. Instead, I suggest you look into a Syquest device. They are a bit more expensive, but you get a lot more for your money. You might try to find a used 44mb mechanism. I got both of mine for a song, and bought all my cartridges used as well. The newer Syquest devices are also quite interesting. They are doing a big promotion on their 3.5" 105mb device. The drive itself is about $300, and the cartridges are the same price as the 44mb units (about $60-$70). Grab a computer shopper and check out the prices. Using Syquests for backups is great! I use Diamond Edge to copy partition-to-partition, and it only takes a few minutes to fill up a 44mb cartridge. If backups are what you want to do with the floptical, you might also look into a SCSI tape drive. Again, a bit more expensive, but you get more for your money. Also, since QIC-150 devices are considered "dinky" by today's tape capacity standards, you can often pick them up on the used market for very attracive prices. Check out misc.forsale.computers.

Of course, Hitachi makes some very nice drives as well :-).

> available from system solutions in the UK.

They are actually replacements for the little rubber "muchrooms" in the keyboard. The new ones just have more 'click' than the spongy orignal ones.

Personally I wasn't that impressed when I first got them but now either wore in a bit of I got used to them and they're now much better than before. :-)

Installation involves removing the back of the keyboard, this involes undoing about 50 million ;-) screws, exchanging all the muschrooms, then putting it all back together again.

Sounds easy but it's tricky, because when you put the keyboard down to put the back on and do up the screws the pressure on the keys pushes them all out and the back up. ;-)

I must say I was pleased when it was all back together and finished. This was until I noticed the '.' key on the numeric keypad was permanently down and had no click. Guess who had to take it all apart again and put in the misssing mushroom. Arse. :-(

> I can check this out if anyone is interested though- I have the info at
> home.

I got mine for 20 UKP from as you say, System Solutions.

>I know that the output from the ST is a different frequency, perhaps someone
>knows of a kit/ box of tricks to do the necessary ?

It is very unlikely that your VGA mono monitor is 50 Hz as 60 Hz is the
minimum VGA frequency.. You should try and connect HSYNC, VSYNC, GND and
MONOCHROME output to the corresponding pins of the VGA monitor.
Connect MONO DETECT to ground so the ST will set itself to MONO mode.
Check what picture you get. It will probably roll over and over. Try and
find a variable resistor which adjust the vertical frequency of the monitor
and turn it until the picture stops rolling. Maybe you have to adjust the
horizontal width and vertical size. In most monitors the trimmers are named
eg. V-SIZE, H-WIDTH, H-PHASE, H-FREQ, V-FREQ, V-SIZE etc.

A word of warning: The monitor uses quite high voltages so please be
careful. Use isolated adjusting tools!

Good luck,
Gert

From: gert@ttgk.textlitho.nl
Message-ID: <Up-EEUAADVI@ttgk.textlitho.nl>
Source record: 32601

In <1994May19.122006.12971@jet.uk> Dennis Armstrong wrote :

>Has anybody got the full specification for the TT video signals? The service
>manual does not have the technical spec.

Horizontal frequency: 74 kHz
Vertical frequency: 71 Hz
Pixel frequency: 95 Mhz
Video memory size: 153600 bytes

The videofrequency is generated by a PLL circuit from National
Semiconductor (DP 8530) and is locked to an 8 Mhz source clock from the
TT-MCU. The shifter is also a National Semicondutor chip (DP 8516) which
drives the monitor directly with ECL output.

I used this info to connect a Viking 1 monitor (21"), I also had to adjust
the monitor (vertical frequency and screen width)

Greetings,
Gert

What makes it more than just a preprocessor is that it does syntax and
error checking such that the C compiler is just an intermediate stage.
Thus from the user standpoint, the C conversion and compilation is
completely invisble. As Warwick states, p2c and f2c are similar in
this respect.

From: GARY.RATLIFF@starnetbbs.com
Message-ID: <13F0D6A0@starnetbbs.com>
Source record: 32616

GE>Can someone tell me where I can get info on the layout of
GE>the boot sector, FATs, and directory structures for the
GE>ST?

There is a public domain program called Disk Doctor which I obtained
from BRE Software which is a disk editor. This allows you to view any
of the sectors of the disk and alter them if you dare.

The directory is at sector 7 odf track 1 if I remember correctly.
Anyway by scrolling thur this a sector at a time one learns the layout
of the ST disk and also learns it is almost identical to the IBM disk.

Got out my IBM Programmers manual and couldn't locate any detals on the
FAT. So perhaps some others can contribute more on this.

>remove "-mbaserel" and "-mpcrel" from the command line.

It works fine with -mbaserel, you just need to omit -mpcrel. And you only
need to omit that for a couple of the modules.

>>So, there are some major problems here.
>Only one!
>Your program is to big to use relative addressig!
>This might be solved by fine tuning linking order,

No, unfortunately it's more involved than that. I've been working on some
patches to make it all fit, but it's been kind of tedious. The biggest problem
is that the insn-output.o module needs to split into multiple parts in order
for all the references to it to fit within the available range. A lot of work
for a minimal performance improvement...

I made the same patches in 2.2, but unfortunately an overzealous sysadmin here
deleted my old source trees and I'm stuck duplicating my work again. Sigh...

|> After a while I get a sudden repeating key. I use a trap to read the
|> keyboard while playing, and use BSW DSP modplayer. Does anybody know the
|> correct solution?

My guess is that the modplayer is locking out interrupts for significant chunks of time while it pitch shifts samples (I don't think this can be done on the DSP because it doesn't have random access to main memory - only sequential access via sound DMA).
Key strokes are transmitted by the IKBD to the CPU as pairs of messages - one for the key press and one for the key release. If the level 6 interrupts are locked out for too long, a byte from the IKBD might be lost. If this was a key release message, TOS is fooled into thinking you're hold the key down and key repeat cuts in...
The best fix I can think of is to get a less system unfriendly modplayer. You could also write your own fault tolerant IKBD routine; a lot of commercial games did this on the ST to read the joysticks (as opposed to installing a joystick packet handler).

You could try the Gnu Multi-Precision Library (GMP) on a.a. While most of of it is written in C the really lowest level code has inline asm. Also the algorithms are faster (eg Karatsuba's mult alg) than the naive ones you would use for small ints.

There is a function tfork() in the MiNTlib that does exactly this. It takes as parameter the address of the function to be executed concurrently. Of course, this function must not return, but rather kill() itself when it has ended.

No. The best way is to check if the AES support the appl_getinfo-call (all AES's > 4.00, Mag!X > 2.0 AES, Falcon-AES, or any AES that finds an application called '?AGI' (if none of the other conditions is true). appl_getinfo has a mode to detect the language of the system an application is running on, but don't ask me how... I must check my sources for that :(

If the AES don't support appl_getinfo, and if you can't find the _AKP-cookie (check AES first!), then check the OS-header.

Ciao

Thomas

P.S.: appl_getinfo doesn't return all country-codes, only the most frequent ones, if I remember right.

Today I received an 85 meg harddrive from a friend an I have no idea what type it is? I have a suspicion that it may be an IDE, however I can't be sure.

Here's the details:

Western Digital Caviar 280
3'5 inch mechanism.

Drive paramters: 980 cl
10 heads
17 spt
85.3 MB
40 pin connector
MDL: WDAC280-52
DCM: BCABAA

Does anyone know anywhere unused Falcon 030 TOS style EPROM's are available from in Australia since Atari seems to no longer be trading in this country?

So if anybody has any info would greatly appreciate a reply.

Thank you.

Anthony Green

>read about it has been in 'QL World' magazine.

>Assuming this is the case (and flame if I'm mixed up somewhere ;-)

>> What programming languages exist- LBASIC was mentioned, is there
>>a version of C in the pipeline?

I have ported Xlisp, xscheme and scm(another scheme), other folks
ported REXX awk, ...
Porting this stuff was realy easy with the c68 compiler
(easier than from unixV to BSD or vice versa)

>There is a fairly good C compiler for the QL, but nothing that gets
>anywhere close to GNU C or Lattice C

I must definitely flame this, c68 available for QDOS and SMS2
is very small (.i -> .s phase about 110K) full K&R and ANSI
and some extras (printf format string checking ....)
AND FULL sources and extensive libraries(curses,regexp ....).
AND FREE
AND ALL relevant GNU utils ported(except gdb, this is a real
drawback)

The library makes great effort to make porting unix programs
easy, only differences are in fork/exec and this is much more
comprehensive under QDOS/SMS2 than unix.

Xwindows is not ported, nobody attempted to make it work with
a QL (<2Mbytes in the vast majority).
Otherwise it should not be a problem.

The provided window system is very easy and extremely effective
to use - makes intelligent use of the keyboard, pointer/window
placing strategies etc..
There is already a quantity of programs from the QL which use
this window manager and there are programs to generate
GUIs (not an trivial task under SMS2 or QDOS).

>> How similar to Unix is the multitasking?

c68 libs make it appear very similar, otherwise very different,
extremely fast job-switch (about 0x68 bytes context information
under QDOS)

>Not particularly. MiNT is closer IMHO

>> Does it support the standard ST/PC disk format (for floppy and

at least flopies, easy to use

>> PD software was mentioned- how much is there, and where could I

>Well I assume they mean the *vast* quantity of QL PD ;-) There is not
>really a lot out there.

>> What is it like to use on a 1mb floppy drive system?

>Should be very good. Its a lot more compact than TOS.

I use QDOS with 1 720K floppy, it is excellent except for use with
the c68 compiler which already claims most of this 720K
(cpp,c68,as68,includes,libs,make ....)
But I can setup dynamic ramdisks and that makes it work.

>IMHO don't bother. I've had a bit of experience of standard QL QDOS
>(which as I said I *believe* SMS2 to be an enchanced port off, and in most
>ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
>be its compactness and efficiency.

some advantage is the THING system.
A THING is an named block of memory - or object, depending
how modern you like to view it.

THINGS may contain system extension, executable code,
shared data or something else and may provide their
own init,cleanup etc routines.
Extensions in things may also use a very sophisticated
parameter description/checking

This provides fairly sophisticated and fast job communication
without such overhead as with REXX or similar.

In my view the biggest difference between QDOS and SMS2
on the one hand and UNIX,MINIX,MINT on the other side is
the resident program concept of QDOS/SMS2, that means
shared code of program instances, but also requires
reentrancy of the programs.
Since the THING system it is easy to manage your
resident programs.

A drawback of QDOS/SMS2 is that they are best programmed
in assembler,basic or prolog, the c compiler has difficulties
with reentrancy.

Bye Richard

I believe only Ataris with 030's and above (dunno about 020's) have
memory correction, so you are right on this...

>b) Is it true that virtually any program running under BSD unix can be
> compiled under MiNT using gcc?

Dunno, but probably (with a patch here or there no doubt)...

[STuff deleted since I have no idea of the answers :-)]

>By the way, has somebody written a BSD like 'ps' for MiNT, accepting standard
>options like -ux and so on. Otherwise this will be the first thing I'm going
>to do.

Have you gotten the MiNT and/or GCC utilities archiver (probably
mntutlxx.zoo) - I believe it has versions of ps.ttp and other helpful
utilities...

It's a good thing it's a good product, since its your only option right
now for building colour RSC files... :-\

> The most impressive part of Interface is the Colour Icon Editor. It is
> very easy to use, and even imports MS-Windows icons (there are TONNES
> of them lying around ftp sites).

Does this let you do things that ORCS can do? ORCS lets you load an IMG
file, and clip part of it out for use in an ICON or IMAGE object; this
is very slick and handy (in fact, I've just uploaded a HUGE collection
of bitmaps for this purpose... look for aicons.zip on atari.archive).
Interface should (hopefully) support colour XIMGs and maybe GIFs... does
it?

Hmm, sounds like he wants to use Warwick's GEM++ class library; that
sort of thing (custom AES objects) is one of the things that GEM++ makes
VERY easy...

And GUI programming in C++ is very sweet...

I'm having problems with the setup of my project to dump files from my Falcon via nullmodem to my 486. I managed to "dl" a ASCII transfer from PC to Atari using Terminate and ConNect, and that's all!. Which is the best software on each platform to do a highspeed file transfer and which is the best settings?

The reason for this is that I want to backup the entire HD of Falcon and then make a scheduled backup to my PC tapestreamer.

Lars,
MidiNet BBS - MIDI ONLY!!! +46-40-160655

While I will freely admit the C68 is a good C compiler, and IMHO has
done more for the revitalisation of the QL scene than anything else
recently - I *still* don't think its as good as GCC with decent MiNT libs.

This is based on trying to port several programs using it, which had
previously been ported with GCC to an ST.

Its alot better than some of the original QL compilers though.

Roland.

There was a lot of controversy about this and I've fitted (and blown up)
quite a number of these blighters into both ST's and STE's. I've always
found the CO-25913-38's to be fairly stable. It seems that these had no
buffering (something which I can vouch for) to the outside world and thus
had a tendancy to blow up. There were various moans that they didn't have
sufficient drive for some HD's but much of I have found to be down to bus
timing rather than drive levels. I seem to recall that the SCSI-2 spec
reduced the transition timing from 2.4uS to 2.2uS and this caused me probs
on my trusty Mega when adding a shiny Quantum ELS drive - the solution was
a ridiculously short (about 4 inches) DMA lead (on ICD h/a BTW).

Cheers, Martin.

>
Yes but it needs modding if you want to use HD disks in it (it'll work OK
as a 720k as is though).

You need a kludge to do 1.44 on the ST's - this involves doubling the clock
rate to the FDC. This can only be done on certain WD1772's as it pushes them
to their limits (they were designed for 10Mhz clocks).

Alternately you can buy a module to do the job for you. If you really want
to have a go at kludging it, I have an archive on the BBS here that I wrote
as a followup to the original article in the German ST-Computer mag, that I
can send you - mail me....

Cheers, Martin.

Not quite, but there's MiNT/MultiTOS that can provide you with many of the features found on Unix systems and many standard Unix utilities have been ported to the Atari. You can even install and use a Unix compatible filesystem (actually Minix) with variable length filenames. Very convenient! Apart from that, Linux could become available for the Falcon in the not to distant future if all goes well.

You should be able to hook a second floppy up to the Falcon as a scsi device, although I am not sure that is the answer you are looking for.

2667. External drives thru

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-21 19:48:59 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994May21.194859.23501@bradford.ac.uk>
Source record: 32638

Is it possible to make a lead/box/anything thats allows a floppy thru such as in the old atari ones, in a modern drive with just a lead coming from it to the atari.

I wanted to do this so I could plug my mini-discovery cart as well as an external drive. Does anyone know of any modifications that are possible to change the cart in case there is no way of getting a thru-port?

Thanks in advance

Paul

From what I understand, internally the Falcon does contain an AJAX
chip that is capable of driving two floppies. But due to case design
Atari was not able to put an external floppy port in. So if you don't
mind hacking up your motherboard, you can attach a second floppy.

```
==========================================================================
(i) Make sure you have the sharable versions of the MiNT libs in /usr/lib
(or where ever you have your libs) and compile with the -mbaserel
-mpcrel flags.
(ii) Many programs won't link properly as some the references become greater
than +/-32K.
==========================================================================

(i) Since the libs reference data through a register, and registers are
"obviously" per-application, then it follows that MiNTLIB in -mbaserel form
could be used as a DLL type of library, right?

Obviously this would require extra support programs, and it could be better
to just statically link everything for speed, but if the calling procedure
were fast enough, having the libraries REALLY "shared" could ease up on
memory requirements. Also, I don't think -mpcrel is required, is it?

(ii) If you use an 030 and the -m68020 option, then this limit shouldn't
exist. I'm not sure if the compiler supports it or not, but the 020 and 030
can do 32 bit offsets.

From: ekl@sdf.lonestar.org
Message-ID: <Cq6Bu0.HF@sdf.lonestar.org>
Source record: 32648

```
==========================================================================
There is a function tfork() in the MiNTlib that does exactly this. It
takes as parameter the address of the function to be executed
concurrently. Of course, this function must not return, but rather
kill() itself when it has ended.
==========================================================================

If the function returns, it returns to the tfork call, which has a call to
Pterm0() <<or maybe Pterm()>> embedded within it. In fact, tfork is
structure so that if MiNT is not running, the function is called as a normal
function, with the main program blocking, so its best to NOT put the call
to Pkill in your function!!

I wish MiNT had a real fork though!

Why can't Pfork() and Pvfork() be modified to be non-blocking? POinters
in the original code or something?? Data is never copied anyway for
Pvfork(), just Pfork(), so Pvfork() should be unblocked, right?

>
> Be careful about buying Amigas. The word is out that Commodore is folding.
> Don't know if anyone will pick up the Amiga line.

From what my local Amiga dealer has been telling me, Commodore isn't actually closing down. According to this dealer, the announced liquidation of Commodore is to wipe out their debts at a discount rate. The head of Commodore in Germany has apparently said that a buy out deal has already been made with an as yet unnamed Asian company. According to the that manager, the Asian company has agreed to continue to develop and market the Amiga as a home computer (but I'm expecting them to also release other products using the Amiga custom chips. Hewlett Packard are using Amiga chips in a cable TV "set top" product). Assuming that the above is true, it will take a few months before the matter is settled and things get back to normal on a world wide basis.
Several of the Commodore branches, such as Canada, Germany, England, Italy and Scandanavia *have* made public announcements that they are *not* part of the liquidation and are continuing with normal business. For the time being they are relying on stockpiles of unsold computers.

vfork blocks in real bsd too. The child runs in the same
address space as the parent for speed, so it just sets up what it
needs to and execs a new program. At this point the parent wakes up,
exactly like in mint. The only difference is that under bsd, the
child can change the memory owned by the parent (by sbrk). So, if
mint followed this behavior of bsd, and had a way to wake processes
from Pvfork's, a real threaded fork would be possible.

Does anyone have any assembler code for drawing filled polygons/triangles and lines on to the screen (ideally doing clipping if they are off the edge)? I am working on a game (in 16 color low resolution) and the VDI routines are way too slow.

Is assembler the fastest way to do this, or is it worth trying to use the blitter chip? Anyone got any docs (or code examples) about programming the blitter?

Thanks,

Shawn Hargreaves "God is real, unless declared as integer."

>> The most impressive part of Interface is the Colour Icon Editor. It is
>> very easy to use, and even imports MS-Windows icons (there are TONNES
>> of them lying around ftp sites).

There are two things I miss in Interface which I prefer in ORCS.

1) mouse/pixel x-y cords. Most icons & bitmaps are fairly small so you don't really need the cordinates, but if you are working on a large bitmap (e.g. a 64x64 logo of the app that you are working on), it really helps out.

2) the ability to change an object's size to something smaller than it should be. I'm constantly creating bitmaps that aren't divisible by 8 (e.g. 20 pixels wide). Even though the bitmap is 24 pixels wide, I'm only using the left-most 20 pixels, In ORCS, I'm able to change the width of the object to 20 pixels wide, but Interface won't let me (feature/bug).

Who cares, right? Well, if I'm doing something like an objc_find(), and the mouse is over the right hand side of bitmap, I'm going to register a hit. Yes, I could always change the width of the object from within my program, but I don't like to because:
1) This will increase my source code and my executeable size. Wy should I increase my program's size when this sort of thing should have been done within the resource the first place?

2) If the bitmaps & icons are the size I want them to be when I'm editing my resource, it makes it that much easier to arrange and layout my dialog.

3) I'm spoiled. After using ORCS, I've grown used to having this feature/bug.

Does anyone know how to do this WITHIN Interface? I know how to change the size within my C code, but reason #1 explains why I'd prefer not to do this. I've tried turning off all of the warnings and protection within Interface, but noting seemed to help. Also, my version of

Interface is v2.0. I noticed that someone here mentioned that the latest versioon of Interface was 2.3. What has been changed from 2.0 to 2.3?

Well, what I have done is only to save the mail-messaging containing the
patches. You would manually have to apply each and everyone of them,
probably also in the right order. I believe it's about 50 or so patch files....

My advise is one of two:

a) Go back to mint-1.09
b) Wait for mint-1.11

For the extremely desperate; send me email, and I will mail the
patches. Tar'ed and gzip'ed they weigh in at ~100k.

I understood that...

|> remove "-mbaserel" and "-mpcrel" from the command line.

Of course, but I wanted a baserel compiled gcc to go with Howard Chu's
new patches for mint. (Which doesn't free the memory occupied by
shared mem programs, and therefore restarts programs allready loaded once
very quick).
As I have a lot of memory to throw away to keep gcc in memory at all
times, I wanted to do that.

|> >|> Maybe it helps to comment out the line
|> >|> #define YYDEBUG
|> May be but also may be not!

|> Your program is to big to use relative addressig!

Yes, probably. But there *are* versions of gcc-2.4.5 compiled with
-mbaserel, so I thought I would try to see if gcc-2.5.8 would compile
easy with this flag as well. Not so.

|> This might be solved by fine tuning linking order,

Aha. That was a good tip.
It would be nice to know what was done in order to compile 2.4.5 with
-mbaserel though. It shure would make things a lot easier.

The Ajax chip has nothing to do with the fact of driving two floppy drives.
The drive selecting is done (in ST/STE/TT) by the sound chip. As far as the
floppy controller (=Ajax) is concerned you may connect even a dozen
drives... It does'nt even know which side of the disk is being used! (this
is also controlled by an output line of the sound chip)
I'm not sure if the Falcon has the soundchip actually still inside or if
it's emulated by a custom chip. In that case it may prove impossible if it
doesn't have the extra drive select output.

>the blitter?

You could setup a large virtual screen and use the blitter to continously
copy the 'visible' part to the screen. In that case you wouldn't have to
worry about clipping. The the screen acts as a viewport on that large
virtual screen.

For programming examples you could get the 'Atari ST Intern' book or
'Atari ST/STE/TT Profibuch'
Maybe there alos some textfiles about this on the net.

It certainyl can. You can load colour XIMG files too (I made a GEM NetHack
icon by simply loading one of its image files and clipping out the part
I liked).

I don't know if it loads GIFs - probably not - I didn't see it mention
that. You could always convert GIFs to IMGs first.

Since the Falcon BLiTTER partially controls the internal IDE
interface, Atari didn't provide an 'off/on switch' for it --
I've HEARD it may be possible to disable through some software
hacking, though.

I have never seen anything that changes the mono screen border to white, but
it is probably possible.

> Another question: can the borders be filled up with the ST's window instead, so you would
> get a bigger desktop?

You can adjust internal pots to make the image fill the screen (though
I prefer the more dense regular display size). To actually get a bigger
desktop, you should look into the Overscan and Autoswitch-Overscan products.
I believe Overscan is a home brew thingy (instructions on atari.archive),
where Autoswitch-Overscan is a commercial product (by the same folks, I
think).

A related program is Monster, which gives you a huge virtual desktop. The
screen acts as a window to this big desktop, and scrolls when the mouse
approaches the screen boarder. Lots of things work fine with this little
hack (Pagestream and Neodesk being two). It can be very nice for DTP work.
It is also on atari.archive.

2696. Problem compiling mint 1.10

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-23 08:53:34 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-230594085334@ngalm099.gal.nt.com>
Source record: 32670

```
Hello All

I am attempting to compile Mint 1.10 (mint110s.zoo)

My setup is: 4 mbyte STFM,128 mbyte HD, no acc's,folder200 in the auto.

gcc-atariST version 2.5.8 Patchlevel 1 (plus other gcc- binaries).
include files from mntinc44.zoo
libs from mntolb44.zoo

In the makefile, I commented out the following:

YACC = byacc -b y_
YTABC = y_tab.c
YTABH = y_tab.h

DEFS = -DMULTITOS -DDEBUG_INFO
#DEFS030 = -DMULTITOS -DONLY030
DEFS030 = -DONLY030

CFLAGS030 = -G -Wall -O2 -fomit-frame-pointer $(MODEL030) $(DEFS030)
ASFLAGS030 = $(MODEL030)

I removed the '-02' flag from the 'CFLAGS' line.

Make 'makefile' produced the following:

gcc -G -Wall -fomit-frame-pointer -mshort -c bios.c -o bios.o
In file included from P:\GNU\INCLUDE\MNTINC\osbind.h:120,

Gv> Falcon.

Indeed, I have a HP ScanJet IIcx connected to my TT

Gv> - Is there commercial scan software which uses a SCSI scanner ?

I use Cranach Previsison in combination with the appropriate GDPS driver this gives satisfactory results. IMHO the scanner has more options than the software uses, but it works allright.

Gv> - Does anyone know what kind of SCSI commands such a scanner uses ?
Gv> (especially the commands of a Tamarack 6000c A4 color scanner)

Most flatbed scanners these days comply to the TWAIN standard. I think this standard has all you need to know. There are probably descriptions of the commands around (wouldn't know where though)

CU around,
Marcel

```
+-- This was written in a previous article by DuncMan...
|> Duncan (75% certain to save up and buy SMS2)

Well, here I am again. Having read the ST Review feature (The
mag really has improved since I last read it), some useful EMails from
readers, and the posts stuck here, I've been reconsidering my opinion. I've
tried to draw up a list of each system's advantages and disadvantages.
If I've got anything wrong, then please correct me.
AFAIK, there are currently 5 multitasking replacement O/Ss that
will run on an STE. My system is rather minimal, being just 1Mb with no
HD. This has coloured my opinions a little, understandably.
Oh, and it was ST Format that thought SMS2 was the same as Unix...

GEM type O/Ss
-------------

MultiTOS
--------
for: The official standard
Pre-emptive
Built in desktop
Compatible with MultiTOS (!)
against: Bugged (alledgedly)
Needs 2Mb & an HD
Tricky to configure
Slow
Uses GEM-style interface

Geneva
------
for: Fast
Stable
Extra facilities over GEM
against: Needs 2Mb
Runs .TOS & .TTP programs in single tasking mode
Co-operative
Does not replace entire O/S
Needs separate desktop
Limited features
Not fully MultiTOS compatible
Uses GEM-style interface

Mag!x
-----
for: Very fast
```

Stable
Built in desktop
Runs .TOS & .TTP programs in multitasking mode
Compatible with TOS/GEM
against: Needs 2Mb
Uses GEM-style interface

Non-GEM type O/Ss

OMEn
----
for: Versions coming for other systems
Built in desktop
Device drivers
against: Not compatible with TOS/GEM
No apparent support yet
Not available yet

SMS2
----
for: Pre-emptive
Very fast
Very small
Built in desktop
Built in networking
Device drivers
Works in 0.5Mb & no HD
against: Not compatible with TOS/GEM
Object oriented (jargon!)
Little apparent support yet
Needs separate MSDOS/TOS disk reading software
Relatively expensive

I have to admit, I don't much like GEM. It looks somehow
primitive (this is understandable when you consider how old it is) (as
does MS Windows, IMHO). I'd rather be using a computer with a more
professional, capable feel. SMS2 gives me that impression.
There isn't a whole lot of software yet, but what there is looks
rather more capable than a lot of the GEM stuff that exists. I also like
the use of a 6*8 font in SMS2 and OMEn- allowing an 80*25 terminal emulator
to sit in window, or lots more columns of a spreadsheet to be seen at
once.
I'm not sure I want to stick with an O/S that is based on TOS,
let alone GEM. I'd like to be able to share data with my exsiting
GEM/TOS software, but that means being able to read the disks. A few
people have said that there is an SMS2 program to do this, but I haven't
heard anything about this on OMEn.
In summary, then;

Duncan (85% certain to save up and buy SMS2
60% " " " " " " Mag!x

```
60% " " " " " " OMEn
40% " " " " " " MultiTOS
35% " " " " " " Geneva)

2700. MinixFS question....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-23 13:16:49 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2rqac1$ouj@clss3.bangor.ac.uk>
Source record: 32678

hello,
I'm contemplating installing a minix partition for use with mint and gcc.
Am I correct in thinking that files on a minix partition cannot be accessed
from GEM ? If so are there easy ways of moving files backwards and forwards
between GEM and minix partitions ?
I understand that minix gives a lot of the UNIX type file structure such as
file permissions, large file names, etc. What other advantages are there
using minix as opposed to sticking with a GEM file system ?
Cheers for any help !
Dylan

I called a few of the places manufacturing parallel port backup devices, and
asked if they would allow me to write GEM based software for the Atari
series of computers. All I needed was the codes which are sent down the
parallel port - I would be prepared to buy the backup device.

In all of the cases, the answer was "bugger off, its a secret".

>
> Coming up with a way to use the internal PC tape drives would probably be

As far as I am aware, the cheap internal ones are IDE - (I have no idea how
a Falcon would see it though !)

Well, I think the basic rule of thumb is that you *shouldn't* access minix partitions *if MiNT/minix.xfs* are not loaded. You can in fact access those partitions in such a situation, but you won't see what you should see on them, and writing to them then might corrupt things.

However, with MiNT (and minix.xfs loaded) you can deal with TOS and minix partitions just the same. You can use your "cp" command/program to copy between them. You can even use UIS III as well for most things (this is what I do for the most part for my copying back n forth). I'd guess the desktop copy might even work as well (I generally avoid the desktop anyways)...

The beauty of the XFS setup is that it seems almost transparent (now if someone would only write a SPECTRE.XFS :-)

2706. Damn this serial port!!! Can it be fixed or not??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-23 22:43:56 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <2rrbjc$6f5@geraldo.cc.utexas.edu>
Source record: 32683

Hi all,

I have tried on several occasions to fix my serial port with the available software patches, always to no avail. The announcement of hsmodem04 on c.s.a.st prompted me to waste another evening on this futile task. My serial port refuses to be fixed.

I have a Telebit Trailblazer operating in PEP mode with data compression. The baud rate between the modem and the atari (8MHZ ST, TOS 1.0) is set to 19.2K. I have tried serialfix and hsmodem, 2 different zmodem programs (can't get Connect's zmodem to work at all), removed all TSRs from my auto folder, increased the size of the receive buffer, ...

Zmodem consistently reports a CRC error after every 14336 bytes (receive buffer of 256 bytes). If I increase the receive buffer to the maximum (64534 bytes), the CRC error occurs after every 16384 bytes. Does anyone have a clue why the errors always occur at these intervals? It seems to only loosely related to the size of the receive buffer, so can it really be that the receive buffer is overflowing?

Is it possible that there is something in my zmodem or my Telebit setup that could be causing this problem. Maybe I should be looking for culprits other than my ST. Does anyone have hsmodem working well on an 8MHZ ST with TOS 1.0? Why do I continue to use this machine???

Thanks for any help,

-Tim Gallivan

I'm wondering if it is your modem or the hardware in the machine.

I have a 1040STF, 1Mb, Tos1.0, run the serial port at 19200, use a Dataflex
Rapier+ v32bis and have had no problem with any of the serial patches.

For the past 4 months I have been using HSModem2 and have just started using
HSModem4. I know this doesn't help much but HSModem2&4 certainly do work.
I use an Atari version of KA9Q mostly, but also use a simple vt100 terminal
emulator as well. I have use Connect to see what it is like, all worked ok.

For HSModem4 I answered the questions as:

```
FASTINT Y
RSVE N
HISP N
REPL u u u u u u
DTR Y
RBL 4096
TBL 4096
```

Has this been done? I've written code to read a mouse in the joystick-only port, but the buad rate from IKBD to CPU is too slow (5Kbaud?). I am thinking that the same code code be written in the IKBD's RAM and executed there.

Is this at all possible, or is the IKBD totally hard-wired?

GASP! There is no way the extra cost of clipping would outway the cost
of drawing something that is never seen!

Let alone the even higher cost of having to then blit the visible part.

This is the kind of programming assembly language promotes,
unfortunately, as the more complex, FASTER solutions are too much
trouble to code in such a low level language. By all means, write you
polygon rendering code in assembly language, but do everthing else in a
high-level language.

From: nunis@sgp.hp.com
Message-ID: <2rs2mu$2a0@hpscit.sc.hp.com>
Source record: 32690

Hi!

I currently own an ATARI 1040STfm. I have the opportunity to purchase an ATARI 1040STe (1Meg). The problem with this is that the power supply is expecting a supply voltage of 120 (US standard) while here in Singapore the standard supply voltage is 240. Is there an easy way to make the modification such that the US model can be used locally in Singapore?

I am getting the STe so I can have more than 1 Meg in the machine and hopefully, be able to run Emagic LOGIC software. I can get a FALCON here but the price is way too high for me (a hobbyist) since I am only going to use it for sequencing.

Please send email and I will post a summary later. Thanks.

This is a bug of AHDI 6.03, get AHDI 6.061. The only way I found of
recovering the data is to recreate the first sector and sometimes the FAT
as well. If you use DMirror or ST Mirror then you will have a copy of your
FAT.

2716. Bug in gcc for MiNT?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-24 07:16:12 UTC
From: huveneer@math.ruu.nl
Message-ID: <1994May24.071612.15698@cc.ruu.nl>
Source record: 32492

Hi there,

yesterday I tried to compile the Portable Math Libs. I got really strange errors.
I used gcc 2.5.3 (mint version) and I tried it both under Mint 0.95 and 1.10.

I seem to have reduced the problem to the following simple program, which just
won't compile. I get the error message: "gcc-cc1: Address error".

```
/* start program */
void main ()
{
double a;

a = 1.0234 + 3.1415;

};
/* end program */
```

I don't know what I am doing wrong. There are a few possibilities (in descending order of
probability):

a) I forgot some compiler switches needed for programs using doubles.
In fact I didn't use any switch!
b) This is a bug in gcc 2.5.3. If so, is this solved in newer releases?
c) This is a bug in the mint port of gcc 2.5.3. This can easily be checked by someone
running the TOS version of gcc 2.5.3.

Compiling the above program under different configurations will give the answer to this ...

Thanks in advance,

Richard.

2717. MiNT - full details please

Since reading this newsgroup my eyes have been opened even more to what an atari can do.I have been interested in upgrading the software base for it from the pd and have added new desktops like gemini etc.I heard about MiNT,which I hope if I'm right,is multitasking software for the ataris.If you could send me details on anything on MiNT,such as where I can get hold of good applications that run on it eg. text editors,file viewers,C compiler or MiNT libraries that would run with lattice C or just general information I would be very grateful.

Also if you have come across any software that you have found intersting please could you let me know as I might aswell!

2718. Help-Gcc not working properly

From: gigxr01@nt.com
Message-ID: <gigxr01-240594092358@ngalm099.gal.nt.com>
Source record: 32493

A few days ago, I posted about my problems compiling mint 1.10.
However, it now seems that the problems are not mint related.

I recently downloaded files to set up the GCC compiler.

I have tried to compile simple programs (temperature conversion & hello
world)
to test the setup, & I always get an error with the <include> file.

I am using gcc-atariST version 2.5.8 Patchlevel 1

This is a sample error:-
ostruct.h:32: parse error before `shor'
ostruct.h:32: warning: no semicolon at end of struct or union

ostruct.h:271: character constant too long
ostruct.h:384: parse error before `volat'
ostruct.h:384: warning: no semicolon at end of struct or union

I also get these when just including (stdio.h>

The header files seem to be intact, the zoo files are not corrupt.
Where do I start looking for the problem.

BTW if I leave out the #include <stdio.h>, the FTOC.C file compiles o.k.

|> If you don't have a GEM style interface, how do you run GEM programs?

Thats the whole point, I don't like GEM much, and GEM programs
not much more. I already have single tasking TOS 1.62 in my STE, I can
run GEM stuff with that.
However, if I get a new O/S, I want a new, better interface.
IMHO, GEM just doesn't cut it any more.
Perhaps if they changed the appearance of GEM I might like it
more... Hrm...

The linker doesn't support this, and neither do the compiler, it only
generates 16 bit offsets, if it doesn't fit you are lost.

|> from Pvfork's, a real threaded fork would be possible.

No, no, that's absolutely false. The real problem is the stack.
Under a Unix system that actually implements vfork (newer systems
don't, they have only fork) only the stack is copied, but both
processes continue to see it at the same virtual address, so that they
cannot interfere. But they really run quasi-parallel, just like any
other process.

Under MiNT, you cannot copy the stack without changing its address as
the process sees it, at least you cannot without a real MMU. Any
address stored in the stack would become bogus. But letting both
processes to write into the same stack, well, this would be no good,
at least :-)

Following is a message from Bob Brodie posted on GEnie:

Atari ST RoundTable
Category 14, Topic 24
Message 1 Mon May 23, 1994
BOB-BRODIE [Atari Corp.] at 17:51 EDT

Dear Friends,

For some time now, I have felt that I needed to spend more time with my family. I have been presented an opportunity that will not only allow me to work at home two to three days a week, but also includes a significant pay increase. I cannot in good conscience to my family refuse this opportunity. It is with great regret that I have sumbmitted my resignation effective June 3, 1994.

For almost five years now, my job at Atari has had a very high priority in my life. During that time frame, my two sons have begun to turn in to men, and my little girl into a teenager. My sons have been a real handful the past two years in particular, and my being around them has had a very positive effect on them.

Even though there have been, from time to time, other job offers, my preference has been to remain with Atari. I believe in our products, and they are my personal choice as a consumer as well. If my personal circumstances did not require me to be at home more often, I would gladly remain with the company. It's not often that someone has an opportunity to turn their hobby into their job. I am thankful that Atari allowed me to do just that!!

I am grateful for the opportunity to serve Atari, and the Tramiel family. I have enjoyed my time at Atari, and have gained invaluable experience. I wish the company great success with all of it's products!! If fate should bring our paths together again, I would welcome the opportunity to work with Atari again. It has been a privilege to serve you.

My thanks go out to all of you (and there are far too many to mention here!) that have been such a special part of my life. I have made friendships with people via GEnie that I expect to be a part of the rest of my days!!

Sincerely,

Bob Brodie

You'll get problems with the RAM size of the IKBD. There only a few bytes left.

There are (at least) 2 versions of IKBDs (different ROM).

Help, oh wise ones, to a newcomer.
The 354 drive is driving me crazy because I cannot seem to reliably transfer files from my PC to the 520. Since IBM does not format 360k in the 3.5" disk, is there a way of using this drive in this setup. Is there software/hardware out there to modify the 354 (a doubler like for the 1050?).

Second question. I have a NEC FD1036A floppy drive. According to some instructions I found on the net, there is a problem with some floppys working correctly with the ST on account of the seek rate. The specs for this drive lists the seek rate as 3ms.
Is this ready to go as per installation directions of James Lacassagne "Generic 3.5 Inch Double Sided Disk Drive for the 520/1040 Series" ? (James are you listening in?)

I also have a Seagate 157A hard drive. I am planning to use the cookbook recipe in the FAQ for hooking this up.
Has anyone done this for this drive? Which of the adapters is the best for this rig.

Finally, I missed Dave Small's article on how to add a 5.25 IBM compatible drive to the 520ST. Could someone send it to me or point me to an archive file.

I wish to say that all of you experienced Atarians have been most helpful to me the lowly newcomer. Your archives, FAQs and all the discussions on the network news have been most useful to people like me. Keep it up. Some more FAQs would be useful: for exmple all about disk drives, modems and null modems.

Thanks for your help.

By PC (AT), do you mean IDE type drives?

I used to have older ST406 type drives connected to a ST406->SCSI
controller. This was hooked to a supra host adapter.
Worked o.k, bit slow though.

As you said, you own a standard 1MB STe. You just won't get the best out of GEM with any of the three standard graphics modes. GEM on a Falcon and SVGA is pretty amazing though - it gives a much better working environment. I use 16 colour mode at a 736*528 resolution (you can get much better with a better monitor) and even my old GEM programs look *much* cooler.

And programs which are written for later versions of the AES (ie the Falcon/MTOS one's) are even nicer. If they use the background, activator and indicator bits in the RSC objects you get a great interface that's very NeXT like (in appearance).

You are stuck with GEM though - there's no way anything else will work on the Atari. Although SMS and Omen are very clever they will be limited to a few anoraks.

> Thanks in advance,
> Ivo van Poorten.

Most of accelerators cards requires a replacement of the original 8Mhz
68000 : some 68K work at 16Mhz, but very few. In addition, such cards
have cache memory in order to speed-up applications (if you don't have
cache memory only the internal operations of the CPU will be faster).
The PAK3 card from the German magazine c't allows you to replace the
old 68000 by a 68020 or a 68030 at 16 or 32 Mhz (both with a 688881
FPU) and have 32Kb of second level cache memory. The 68020 version runs
with TOS 2.06 unpatched (I don't have it yet) but the 68030 needs some
small patches in TOS 3.06 (especially for the MMU).
Of course, adding an accelerator card is not an easy job and if you're
not familiar with a soldering, forget it! (or let a resaler do it).
If you want more infos, mail me.
Bye.

2735. MegaSTE crashes!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-24 19:38:12 UTC
From: hopper_t@msupa.pa.msu.edu
Message-ID: <2rtl34$1194@msuinfo.cl.msu.edu>
Source record: 32521

Hello, everyone!

I've been having trouble recently with my MegaSTE 4/52 crashing. The mouse cursor disappears and the whole thing locks up. It seems to happen most often when the machine's been on for at least forty-five minutes to an hour. To restart it I have to reach around and hit the reset button, or just turn it off. Is anyone aware of a problem like this, or what could be causing it?

I thought it might be the surge protector (one of those under-monitor jobs), and since I haven't been able to replace it yet, it might be. The surge protector hasen't been turning on all the time lately; I have to flick the master switch two or three times (sometimes; not ALL the time). Could fluctuations from the surge protector be causing trouble?

I also have Warp9 3.75, DC Data Diet, ICD Hard Drive Driver (latest version, for the ICD hard drive) and sometimes Before Dawn and/or Automouse and/or Safemenu installed, but the problem isn't regular enough that I can tell if it is due to any of these programs.

I have noticed that it doesn't seem to matter what program is running; it can do it at any time, but doesn't seem to crash when I'm actually doing something; if the drive is being accessed, or when I am just letting it sit for a while is when it seems to crash the most often.

Thanks in advance for any suggestions you can offer.

-Tom Hopper

What I meant was to have the same desktop, the same size of everything, but get more additional SPACE on it, so I can have wider windows, more windows open etc.
I'm using an NEC Multisync II monitor.
Is it possible? Any modification I can do inside my STE?

The power supply in the STFM and the STE are the same, so its just a
matter of pulling one out, and putting it in the other. All you have
to do is (once you have the case apart, and the shielding off), is
unscrew the PSU from the base, and disconnect the little white
plug which plugs into the board. Lift the PSU out, and put the other
one in.

As I understood it:

Sinclair originally asked GST to do an operating system for them. The result seems to have been called 68K/OS and wasn't good enough. QDOS was written by Tony Tebby, in rather less time than most people would like to have when writing operating systems. IMHO he did a surprisingly good job, especially by the time the bugs had been cut down a bit...

Tebby has since written SMS2, and also SMSQ (which is much more of a QDOS clone --- it runs on a card which plugs into the ISA bus of a PC.

I believe 68K/OS was actually released separately, but has long since sunk without trace.

As for 68K/OS being SMS --- don't know. I doubt it, but that's just my opinion.

As for compatibility between SMS2 and QDOS... Some QDOS programs will run under SMS2. Of the QDOS programs which *won't* run under SMS2, not all of them will run under all version of QDOS either...

Generally speaking, programs written in C will work on either; programs written for the QDOS pointer environment will work on either; other programs will have to be checked on an individual basis.

(I used QDOS here in Cambridge, QDOS and SMSQ at home, but I've only run into SMS2 on a couple of occasions. Maybe if I come across a cheap 2nd-hand ST...)

Yes, the QDOS file system is not one of the worlds best; the reason for
this is that subdirectories were rather hacked on as an afterthought.

>I assume SMS2 has at least level 2 device drivers, but it"s
>more likely to have level 3 device drivers. Level two

I'm told that SMS2 originally included the appropriate code but it was
removed after it turned out to be slowing things down for some reason. I
don't know if this has been solved yet.

I wrote: you COULD setup a large etc..
I didn't say you HAVE to :-)

It was just an idea and for most of the users which are fiddling about with
this it will do just fine.

Most clipping problems are re-entering graphics from rightedge into
leftedge and vice versa. (that is if you write to the screen directly)
By creating a larger field this can be overcome quite easily.
(remember the old XL which added an extra column on the left and right hand
side for smooth scrolling, the C64 had the same feature)

It's just depending on what you want to do...

Gert

From: bduewer@jabba.cybernetics.net
Message-ID: <2ru8pl$pta@jabba.cybernetics.net>
Source record: 32531

Greetings!
My system is a mega2 ST, w/ an ICD host adapter controlling and
SCSI-RLL controlling and RLL 30 meg drive. All of these components
are several years old.
When I bought the host adapter, some ICD software came with it that is
now probably most ancient, and I would like update things a bit.
I noticed that ADHI 5.0 is on umich, and I still have the old software. Another
option would be if there were some way to get a newer version of the
ICD software w/o 2400 baud long distance to the ICD BBS (any kind soul
willing to mail to me? if you do, tell me before mailing so I only
get one copy. I'm not looking for the professional version, just
the one I'm supposed to have the right to get updates for).

Anyway, replies in email with advice regarding my situation are
very appreciated. I don't always keep up on the messages here and
would neither want to miss anything important, or waste BW further.

Thank you for your time and assistance!

Bruce Duewer

It's a CPU replacement plus. You not only have to replace the CPU, but
the replacement must have an on board cache to gain you any speed at all.
The ICD AdSpeed STe also has a socket for an FPU.

2747. Upgrading TOS and MTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-25 03:11:32 UTC
From: Graham.Irvine@mettav.royle.org
Message-ID: <769832546.0@mettav.royle>
Source record: 32529

It was none other than Rod McCall that wrote on 20 May 94 that ,

RM> system: FALCON 4/65
RM>
RM> firstly where do I get upgrades for TOS to make it 4.04 from 4.01

Compo Software (0480 891819) that is the last number I have for them but I think they may have a new office these day's (?).

They are licensed by Atari to reprogram or if required replace your TOS. Quite cheap in the former and AFAIK if they do have to replace they put a reprogrammable ROM in so it is cheaper to upgrade in future.

> >cation called '?AGI' (if none of the other conditions is true). appl_getinfo
> ^^^^
> Never heard of that! Any more details?
In fact, that's not a real application. It was an idea (developped in the
german Maus-net, I think) to make it possible to detect whether you can call
the (extended) appl_getinfo. Best bet is to ask Martin Osieka about it (author
of WINX). I dunno the address by heart, but I'm sure it can be found in the
docs to WINX.

Sorry to say, but in my posting quoted above, there's a little error: It's not
AES > 4.00 and Mag!X > 2.00, but AES >= 4.00 and Mag!X >= 2.00. Also note that
Falcon-AES can be 3.31 or 3.40 (3.31 had the lame ;) way for handling 3D-
objects (using the extended ob_type-byte)).

Ciao

Thomas

2750. Minix and MiNT problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-25 08:55:51 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2rv3qn$dmf@clss3.bangor.ac.uk>
Source record: 32536

Hello,

After being persuaded by a couple of people that it would be worth me
installing a minix partition I have discovered that my ICD driver (my hard
drive uses an adSCSI+ card) isn't compatible !
Does anyone know of any ICD drivers (or could I use something else ?) that
can handle minix partitions ?

Another problem I have.....
I have installed MiNT using the MiNT distribution kit. Unfortunately the
man command doesn't seem to work properly. Sometimes it replies with
man: -r option illegal
(I think !)
but most of the time it says that it is formatting the page and then aborts
(it does say sorry though !)
Anyone know why ?

Dylan

2751. Problem with GEM.CNF

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-25 10:08:09 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2rv829$gus@chive.csv.warwick.ac.uk>
Source record: 32508
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

Last night I wanted to change the path for GNULIB in my GEM.CNF file,
but when I rebooted, Multitos crashed just as it was setting up
my desktop.

I tried Mint 1.10 and 1.04, and it still crashed, even when it was the
only program I booted with. I deleted the line that I had changed,
and it still crashed !!

I went back to the original mint.cnf and gem.cnf I got on the Multitos disk,
and it worked OK. I managed to my mint.cnf file back to normal, and part of
my gem.cnf,but then it started crashing again.

Can anyone explain why

```
setenv PATH=.,C:\,C:\BIN,C:\LANG\GNU\BIN,C:\TOOLS\ARCHIVE,C:\MULTITOS\TW14W12
setenv ACCPATH=C:\
setenv ACCEXT=ACC,ACX
setenv GEMEXT=PRG,APP,GTP,ACC
setenv TOSEXT=TOS,TTP
setenv SHSHOW=C:\MULTITOS\VIEWER.APP
setenv SHPRINT=C:\MULTITOS\LPR.APP
setenv TOSRUN=C:\MULTITOS\TW14W12\RUNTOS.PRG
```

works as a GEM.CNF file, as does

```
setenv TMP=C:\TMP
```

but not

```
setenv PATH=.,C:\,C:\BIN,C:\LANG\GNU\BIN,C:\TOOLS\ARCHIVE,C:\MULTITOS\TW14W12
setenv ACCPATH=C:\
setenv ACCEXT=ACC,ACX
setenv GEMEXT=PRG,APP,GTP,ACC
setenv TOSEXT=TOS,TTP
setenv SHSHOW=C:\MULTITOS\VIEWER.APP
setenv SHPRINT=C:\MULTITOS\LPR.APP
setenv TOSRUN=C:\MULTITOS\TW14W12\RUNTOS.PRG
setenv TMP=C:\TMP
```

or infact anything longer than the first example, even though my original
gem.cnf is much longer.

I'd really appreciate some ideas here, as this problem is driving me _nuts_ !!

Thanks,

Paul

If you have a CLI that is able to usr the extended filenames. Like the one distributed with mint then it is posible to copy files from you minix partition to a TOS one and visa-versa with no problems at all. You just can't use gem because of the extended filenames.

>I understand that minix gives a lot of the UNIX type file structure such as
>file permissions, large file names, etc. What other advantages are there
>using minix as opposed to sticking with a GEM file system ?

None, that's about it. I've heard people say it's faster but you probably won't notice it. I didn't.
I have this problem now that there are files being corrupted on the disk but that's probably because I'm using a Falcon.

>provide a good amount of an increase IMO)...

Without the cache there is no point having a 16 MHz 68000.
I had a Hypercache car in my MEGA ST, and with the cache on the speed
was almost double, but with the cache off (but still in 16 MHz) is was
no faster than a standard 8 Mhz - so you definitly need the cache.

2757. QUESTION: Using an PC hard-disk with a 520 ST ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-25 11:50:04 UTC
From: gl@comlab.ox.ac.uk
Message-ID: <1994May25.115004.15832@msc2.comlab.ox.ac.uk>
Source record: 32512
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello!

Is it possible to use an IBM PC IDE-type hard disk with an ATARI 520 STF ?
I ask this question because I have the opportunity to get a (relatively small)
PC hard-disk, and it would be a good way to "upgrade" my 520ST!
Is the HD-connector at the back of my 520ST a special one ? And, if it works,
how to declare this hard-disk?

Thanks for any information.

I've had the identical problem for over half a year, with my 3 year old MSTE.
I'm convinced it's a hardware problem - a cold solder joint somewhere? The TOS
and memory chips are anything but loose. Let me know if you find a solution!

John

2759. The look of GEM ...

I was wondering, just how much could you alter the way GEM feels? For instance, doing away with the sizer box and using a system similar to Open Windows or even Windows. I assume that if a program is written properly you could have a third mouse button to activate the menu relavent to the topped window in it's own box. Why does GEM have to stay the same?

New since last version :
- f030_cd : a new Falcon driver

Updates since last version :
- ExtenDOS v1.11
- Programing informations

ATARI CD-ROM FAQ

25/05/1994

1 - What driver should I use with my Atari system ?

There are several drivers available :

MetaDos :
Free software from Atari Corp.
Available from atari.archive.umich or ftp.muenster.de (metads23.zip)

The filesystem drivers support ISO9660 and High Sierra CDs, but not
multisession CDs.
The device driver only works for the Atari CDAR504 connected to the
ACSI bus or with generic SCSI CD-ROMs connected to the TT SCSI port.
(Answer from Julian Reschke)

CDROM.XFS :
Free software (Copyright 1992,1993,1994 Eric R. Smith, Michael Bernards
u. Gunther Leis)
Available from atari.archive.umich and other ftp sites.

This driver is a Mint extended filesystem and works on TTs and Falcons.
CDROM.XFS version <0.7 does not work with Mint/Multitos > 1.04.
The curren version (0.7) is said to work on Mint/Multitos > 1.04.
It seems to be true on TTs but it does not work with any Mint version
on my Falcon.

CD-Tools :
Commercial solution from Hard & Soft, Obere Muensterstrasse 33-35,
D-44575 Castrop-Rauxel, Germany, Phone: ++49 2305 18014, Fax: ++49 2305
32463

Includes MetaDOS with GEM-based installation program, audio player with
PCM audio data import (only some drives) and custom devices and
filesystem drivers (support for Atari CDAR504 and generic CD-ROMs
connected to ACSI through host adapter, TT-SCSI, Falcon-SCSI,
multisession support (only some drives)).
(Answer from Julian Reschke)

With CD-Tools, you also have a GDPS module and the program Scan-It that
can handle Photo-CD Pictures.
CD-Tools is in German and costs 99 DM.

ExtenDOS v1.11:
Commercial solution from Anodyne Software, 6 Cobbler Court, Ottawa,
Ontario K1V 0B8, Canada.
Available in UK : System Solutions.

Support ST, STe, Mega, TT, and Falcon. Read ISO9660 and High_Sierra
CD-ROMs. It now runs just fine under MultiTOS with no restrictions;
memory protect is OK, and you can run programs directly from CD. It
also runs fine with Mag!X 2.01, with the restriction that the
EXTENDOS.CNF file must be in the root directory.

Extendos v1.11 costs $29.95(North America).
(Information updated by Roger Burrows / Anodyne Software)

F030_CD :
Fairware from Peter Hilbring, Dietrich Otmar Stra�e 16, 59597
Erwitte, Germany
Available on ftp.tu-clausthal.de
(/pub/atari/falcon/systools/f030_cd.zip)

This package includes a BOS driver for MetaDOS, MetaDOS 2.3, a
low level SCSI driver (TT & FALCON) and a program named
cd_explorer as exemple of the access of the low level driver.

I've just tried these drivers on my falcon with an Apple
CD-300 cdrom and it works without problem.
(Info from Vincent Lefevre)

ICD Pro :
Old versions came with a MetaDOS driver named ICDCDROM.BOS.
The new ones comes with a mint extended filesystem.

2 - What discs are available ?

There is three Atari specific CD-ROMs :

GEMini CD-ROM :
From Walnut Creek CDROM, Suite 260, 1547 Palos Verdes Mall, Walnut
Creek, CA 94596, USA, Phone: +1 510 674-0783, Fax: +1 510 674-0821,
Email: info@cdrom.com, Ftp: ftp.cdrom.com
Available in Germany from Ingenieurburo Praefcke, Holtzvogtkamp 55,
24220 Flintbeck, Phone: (04347) 7531.

You can find the index of the GEMini CD-ROM on atari.archive.umich.edu.

Bernd Lohrum CD-ROM :
From Bernd Lohrum, Schlossbergstrasse 36, D-66440 Blieskastel, Germany,
Phone: (0171) 4210222

This CD-ROM costs 69 DM (59 DM for MAUS net users).

Wohlfahrtstatter CD-ROM :
From Wohlfahrtstatter, Irenenstr. 76c, D-40468 Dusseldorf, Germany,
Phone: (0211)429876.
This CD-ROM costs 89 DM.

You can also use all the ISO-9660 CDs that exists for the PCs. You won't
rn the PC programs but you will access all the text, pictures, and sound
files on it.
The discs already tried are :

Corel Artshow 91 :
~ 1000 scans of paintings (like Manet, Van Gogh, ...) in 16 and 256
colors PCX files;
All the images from the 91 Corel draw contest in CDR and DIB format;
some midi files.
The PCX and DIB files can be read with Dieter Fiebelkorn's Gem-View
3.xx .

Clipart Warehouse

3 - Can I use Photo-CD on my Atari ?

Of course You can !
To have full use of the photo-cds, you'll need a multi-sessions drive and
driver and also a program that can handle PCD files.

CD-TOOLS :
The driver from Hard & Soft can read multi-sessions discs and have all
the needed stuff to handle the Photo-CDs.

ColorDisc PCD :
Commercial software from Color Concept, Im Alten Breidt 4, D-53797
Lohmar Breidt, Germany, Phone: (02246) 7132

This program allows you to manipulate the photos on your Photo-CDs, and
save them on hard-disc. It handles Portfolio CDs.
If my understanding is good, it works with metados and a special BOS
file (both included).
It also includes a CD-Audio player.

A demo version is available at ftp.tu-clausthal.de.
ColorDisc PCD works on TTs and Falcons and costs 99 DM.

Studio Photo :
Commercial software from Eurosoft.
This french program can manipulate Photo-CDs.

Gemview v3.xx :
Shareware from Dieter Fiebelkorn, Gr&#65533;ner Weg 29a, W4370 Marl-Brassert,

Germany,Email : fiebelko@bonny.informatik.uni-dortmund.de

Gemview is also capable of handling PhotoCD's. Only in two resolutions (Base and Base/4 I think)

4 - Can I play Audio-CDs on my Atari ?

Of course You can !

The following programs are available :

CD-TOOLS :
The driver from Hard & Soft includes a player for CD-Audio discs. The drive must understand SCSI2 instructions(Or CDAR504 or the Apple CD150).

ATARI CD-ROM FAQ

25/05/1994

1 - What driver should I use with my Atari system ?

There are several drivers available :

MetaDos :
Free software from Atari Corp.
Available from atari.archive.umich or ftp.muenster.de (metads23.zip)

The filesystem drivers support ISO9660 and High Sierra CDs, but not
multisession CDs.
The device driver only works for the Atari CDAR504 connected to the
ACSI bus or with generic SCSI CD-ROMs connected to the TT SCSI port.
(Answer from Julian Reschke)

CDROM.XFS :
Free software (Copyright 1992,1993,1994 Eric R. Smith, Michael Bernards
u. Gunther Leis)
Available from atari.archive.umich and other ftp sites.

This driver is a Mint extended filesystem and works on TTs and Falcons.
CDROM.XFS version <0.7 does not work with Mint/Multitos > 1.04.
The curret version (0.7) is said to work on Mint/Multitos > 1.04.
It seems to be true on TTs but it does not work with any Mint version
on my Falcon.

CD-Tools :
Commercial solution from Hard & Soft, Obere Muensterstrasse 33-35,
D-44575 Castrop-Rauxel, Germany, Phone: ++49 2305 18014, Fax: ++49 2305
32463

Includes MetaDOS with GEM-based installation program, audio player with
PCM audio data import (only some drives) and custom devices and
filesystem drivers (support for Atari CDAR504 and generic CD-ROMs
connected to ACSI through host adapter, TT-SCSI, Falcon-SCSI,
multisession support (only some drives)).
(Answer from Julian Reschke)

With CD-Tools, you also have a GDPS module and the program Scan-It that
can handle Photo-CD Pictures.
CD-Tools is in German and costs 99 DM.

ExtenDOS v1.11:
Commercial solution from Anodyne Software, 6 Cobbler Court, Ottawa,
Ontario K1V 0B8, Canada.
Available in UK : System Solutions.

Support ST, STe, Mega, TT, and Falcon. Read ISO9660 and High_Sierra
CD-ROMs. It now runs just fine under MultiTOS with no restrictions;
memory protect is OK, and you can run programs directly from CD. It
also runs fine with Mag!X 2.01, with the restriction that the
EXTENDOS.CNF file must be in the root directory.

Extendos v1.11 costs $29.95(North America).
(Information updated by Roger Burrows / Anodyne Software)

F030_CD :
Fairware from Peter Hilbring, Dietrich Otmar Stra&#xfffd;e 16, 59597
Erwitte, Germany
Available on ftp.tu-clausthal.de
(/pub/atari/falcon/systools/f030_cd.zip)

This package includes a BOS driver for MetaDOS, MetaDOS 2.3, a
low level SCSI driver (TT & FALCON) and a program named
cd_explorer as exemple of the access of the low level driver.

I've just tried these drivers on my falcon with an Apple
CD-300 cdrom and it works without problem.
(Info from Vincent Lefevre)

ICD Pro :
Old versions came with a MetaDOS driver named ICDCDROM.BOS.
The new ones comes with a mint extended filesystem.

2 - What discs are available ?

There is three Atari specific CD-ROMs :

GEMini CD-ROM :
From Walnut Creek CDROM, Suite 260, 1547 Palos Verdes Mall, Walnut
Creek, CA 94596, USA, Phone: +1 510 674-0783, Fax: +1 510 674-0821,
Email: info@cdrom.com, Ftp: ftp.cdrom.com
Available in Germany from Ingenieurburo Praefcke, Holtzvogtkamp 55,
24220 Flintbeck, Phone: (04347) 7531.

You can find the index of the GEMini CD-ROM on atari.archive.umich.edu.

Bernd Lohrum CD-ROM :
From Bernd Lohrum, Schlossbergstrasse 36, D-66440 Blieskastel, Germany,
Phone: (0171) 4210222

This CD-ROM costs 69 DM (59 DM for MAUS net users).

Wohlfahrtstatter CD-ROM :
From Wohlfahrtstatter, Irenenstr. 76c, D-40468 Dusseldorf, Germany,
Phone: (0211)429876.
This CD-ROM costs 89 DM.

You can also use all the ISO-9660 CDs that exists for the PCs. You won't
un the PC programs but you will access all the text, pictures, and sound
files on it.
The discs already tried are :

Corel Artshow 91 :
~ 1000 scans of paintings (like Manet, Van Gogh, ...) in 16 and 256
colors PCX files;
All the images from the 91 Corel draw contest in CDR and DIB format;
some midi files.
The PCX and DIB files can be read with Dieter Fiebelkorn's Gem-View
3.xx .

Clipart Warehouse

3 - Can I use Photo-CD on my Atari ?

Of course You can !
To have full use of the photo-cds, you'll need a multi-sessions drive and
driver and also a program that can handle PCD files.

CD-TOOLS :
The driver from Hard & Soft can read multi-sessions discs and have all
the needed stuff to handle the Photo-CDs.

ColorDisc PCD :
Commercial software from Color Concept, Im Alten Breidt 4, D-53797
Lohmar Breidt, Germany, Phone: (02246) 7132

This program allows you to manipulate the photos on your Photo-CDs, and
save them on hard-disc. It handles Portfolio CDs.
If my understanding is good, it works with metados and a special BOS
file (both included).
It also includes a CD-Audio player.

A demo version is available at ftp.tu-clausthal.de.
ColorDisc PCD works on TTs and Falcons and costs 99 DM.

Studio Photo :
Commercial software from Eurosoft.
This french program can manipulate Photo-CDs.

Gemview v3.xx :
Shareware from Dieter Fiebelkorn, Gr&#65533;ner Weg 29a, W4370 Marl-Brassert,

Germany Email : fiebelko@bonny.informatik.uni-dortmund.de

Gemview is also capable of handling PhotoCD's. Only in two resolutions (Base and Base/4 I think)

4 - Can I play Audio-CDs on my Atari ?

Of course You can !

The following programs are available :

CD-TOOLS :
The driver from Hard & Soft includes a player for CD-Audio discs. The drive must understand SCSI2 instructions(Or CDAR504 or the Apple CD150).

>box. Why does GEM have to stay the same?

Because AES draws windows with GEM objects (and probably also relies on
the resource tree indices of the gadgets), which are not all too
fancy. And I am sure that had there been more space in the ROM,
then Martin Osieka would have done something essential about the look
of the GEM windows.

I personally think that the GEM distributed with MultiTOS should
provide some extensibility in the form of window manager driver
files.

A Magnifying utility in a GEM window. Handy for Art/Drawing zooms where you need the full toolkit but don't normally get it for example.

> The docs and everything are in German, and sadly, I don't know any
> German. B(

The ubiquitous Joe Connor (jconnor@cix.clink.co.uk) translated it I believe, and runs a UK registration scheme. Check out the ST Club PD catalogue.

re. Recovering partitions. I use KnifeST it's great. One problem though you have to have the partition recognized by the system to use it. So if you get it recognized at boot then you should be able to fix it.

Message-ID: <769932258.AA05704@byte.bbs.no>
Source record: 32441

I have a Mag 15F 15" monitor and a Falcon030, with the screenblaster demo. The specs on the monitor is as follows:

Horizontal f 30 - 64KHz
Vertical f 50 - 120Hz

The monitor works fine in all the allowed resolutions excpept for the true colour one. (That is all the enhanced res. offered by the screenblaster demo.) This does not work.

The strange thing is that the specs for that res. is well within the specs of the monitor, at least as stated in the manual.

Whats even more strange is that before I got the Mag, I borrowed a 14" Acer, and it displayed the enhanced true colour mode without problems.

The Mag has a little led marked "Out of Range" and this is not lit up, when in enhanced true colour mode.

Further more the Mode indicator of the screen never changes from the 640x480 mode even if the monitor is displaying the highest res. offered in 16 colours by the screenblaster.

Any thoughts, ideas, or even explanations are accepted with a smile.

Finally, I think that most of the enhanced modes offered by the screenblaster demo flickers alot. Is this improved with the commercial one?

> Hi there,

> yesterday I tried to compile the Portable Math Libs. I got really strange errors.
> I used gcc 2.5.3 (mint version) and I tried it both under Mint 0.95 and 1.10.

gcc 2.5.3 never worked correctly. Get 2.3.3 or 2.5.8 instead.

> c) This is a bug in the mint port of gcc 2.5.3. This can easily be checked by someone running the TOS version of gcc 2.5.3.

There is no special MiNT port of gcc. It's just linked with the MiNT
library instead of the GNU library.

I didn't say a real non-blocking fork, but real threading.
This does not require copying stacks.
>
>No, no, that's absolutely false. The real problem is the stack.
>Under a Unix system that actually implements vfork (newer systems
>don't, they have only fork) only the stack is copied, but both
>processes continue to see it at the same virtual address, so that they
>cannot interfere. But they really run quasi-parallel, just like any
>other process.
>
From _The Design and Implementaion of the 4.3BSD UNIX
Operating System_ p. 139:
Most of the implementaion of vfork is shared with
fork. The major differnece is that, instead of copying the
address space for the child, the parent simply passes its
address space to the child and suspends itself. The child
process needs to allocate only new proc and user structures,
recieving everythin else from the parent. The child process
returns from the vfork system call with the parent still
suspended. The child does the usual activities in preperation
for starting a new program, then calls exec. Now the address
space is passed back to the parent process, rather than being
abandoned as in a noremal exec. Alternatively, if the child

process encounters an error and is unavle to execute athe new
program, it will exit. Again, the address space is passed
back to the parent instead of being abandoned.

If you have a system which uses vfork, check your man pages. On
ultrix, it says the following: The parent blocks until the child
exits or exec's. And, the child cannot return from the function which
called vfork -- since the stack was not copied.

Later on the same page:
The architectural quirky of the vfork call is that the child
process may modify the contents and even the size of the
parent's address space.
It occurs to me that this (the ability to change the size of the
parent's address space) is exactly the sort of quirk that one needs to
do real threading. Pvfork, however, does not have this quirk.

David Cowan (davidc@vissci.demon.co.uk) wrote:
: The power supply in the STFM and the STE are the same, so its just a
: matter of pulling one out, and putting it in the other. All you have
: to do is (once you have the case apart, and the shielding off), is
: unscrew the PSU from the base, and disconnect the little white
: plug which plugs into the board. Lift the PSU out, and put the other
: one in.

Actually, the old PSU from my 1040STFM is not the original one. I am starting to get really anoying problems with my STFM. Basically, the PSU contained in the STFM is a modified one that rests on a piece of cardboard (the guy who sold it to me is a rather slimy fellow). Anyway, I would definitely like to get a new one and get that to work. Someone sent me mail and said that all I needed to do was to snip off a connection. This sounds like a real good solution to me.

Anyone tried it yet?

While I am at it, just one more question...is there a way to hook up a hard disk and to increase memory using standard PC SIMMs? Is there a limit on how much RAM I can have?

Thanks.

No, but there are many C and C++ libraries providing this feature.
(no use to Jabran, but perhaps useful to other readers)

libg++ has an Integer type which behaves exactly like plain `int',
except it stores arbitrarily large numbers.

Cryptography programs need this Jabran, so perhaps you could look in
a FAQ for sci.crypt or related group for 68000 code.

DW> it's own box. Why does GEM have to stay the same?

Because there's no major company developing our version of GEM, and there won't be one in the future. Atari bought our GEM (version 0.9 if I remember correctly), and then broke with DR. DR went on developing GEM as a DOS-based GUI for a while, up to version 3.0 at least, but killed it because it didn't sell. So we're left with what Atari hacks up from 0.9. Clearly Atari never had the resources to keep up with the pace of modern OS development, and they aren't supposed to. Atari is into the business of selling computers, not of building OS'es. Pity they didn't realize that strongly enough to keep the DR contract alive, back in '85. GEM could have been the first cross-platform GUI-environment, a fact that could have made a significant impact not only on the ST situation, but might have changed the face of DOS computing as well, in those pre-Win31 days.

The refresh of the video DRAM is done by the periodic update of the
screen anyway.... SRAM won't help you. The video logic will still
kick the CPU of the bus to refresh the screen.

> -- ReadMail ST

I pushed the clock of my 8 Mhz STFM up to 16 Mhz, it still worked.
Gembench reported a small increase, CPU 130& , graphics 120%.
I believe having cache would give much better results though.

The blitter can't and never could be 'disabled'. All you can do on pre-Falcon
machines is tell Line-A and therefore VDI not to use it. The Falcon VDI lacks
the non-blitter code, so you can't switch it off. With NVDI, you can.

I think when you do a (F)ollowup message to someone (like I'm doing
here) there should be a choice in the header called "Followup-To:" -
just stick the name of the group(s) you want the followup to go
to there, and it should route everything that way for you.

I generally use "alt.flames" as the followup group for my
responses to the net weasels that seem to be appearing of late :-)

I am considering trying to learn to program in C this summer...or at least try!
I have a program in BASIC that NEEDS to run faster! Anyway, a couple of
questions for C programmers on the ST:
1) is trying to convert an existing program a good way to learn C ?
2) what would you recommend as a good starters version of C ?
eg. commercial, PD, SW etc.

Thanks muchly in advance,

T.T.F.N.

>MiNT now. One contradiction did come out though.Some of you said that only
>tos programs ran under MiNT not any GEM applications that used windows,menus
>etc and other said both.Which is it?

You can go in two directions with MiNT:

1) boot up *straight* into a shell, where you can only run TOS/TTP
stuff (this may save you some memory (like for compiling), and is
nice in full screen) - you do this by setting the INIT= line in
your MINT.CNF file to the program to be initiated...

--- or (and I do this personally) ---

2) leave the INIT= line commented out - this way you will boot into GEM;
under MiNT, you can have *1* GEM program and *multiple* TOS/TTP
programs running concurrently - the best way to run the TOS/TTP
programs from the desktop/GEM is to use the TOSWIN.ACC program
(or the TW variation I think Warwick (?) has done)

For all intensive purposes, when MiNT loads in it should be almost
transparent to any programs running on your system. The programs
(such as TOSWIN) that are "MiNT-aware" can take advantage of its
presence, and any XFS (extended filesystems) should act like any ol'
disk/partition with MiNT loaded in (from the perspective of the
programs runnings on top)...

If it costs you 5$ then you've been had - it's the price of a little
switch and a bit of patience. I've an added to version to cover the Mega
ST here, although it may well be on an ftp site somewhere.

If someone doesn't come up with a site for you, mail me back and I'll
upload it to a.a.u.e or somewhere.

Cheers, Martin.

It's pretty irritating that you never know if the CAPOS lock key is pressed down
or not, before you actually type something.
Is it possible to connect an LED somewhere in the circuit board of the machine, so
it'll light up when CAPS is "on", otherwise it'll be extinguished?

I would like to cut a small hole in the "CAPSlock" key and install a small LED there.
Many thanks.

Hallvard, Oslo, Norway

I suppose it would be possible, as the information would be available from the intellingent keyboard processor..... could be quite tricky, though.

There is a PD program available which various people on the Net reccomended to me a month or two ago.... It's called LED Panel, and as well as showing the date, time and any drive activity in the corner of the screen, it will also give a Caps Lock indicator.... It's extremely configurable, so you can switch the other stuff off if you want to.... Give it a go, you can probably FTP it from most sites..... (It was also on STR a few months back)

If you have trouble finding it, mail me and I'll try and send it to you....

Neil.

That would be me who made that suggestion.

>Anyone tried it yet?

For everyone's benefit, the PSUs used in 110v and 240v STs appear to be
identical except for a wire link. (Most switch-mode PSUs are dual-
standard and have just such a link) When I brought my UK STFM to the US,
all I did was install this wire link to convert from 240v to 110v.
(Thanks to Atari Dealer 'Xanth Corp.' of Bellevue for this tip)
US ST power supplies will need the link removed. There is only one wire
link on the board, located near the bridge-rectifier/resevoir caps.
240v versions will just have two empty holes on the board!

>While I am at it, just one more question...is there a way to hook up
>a hard disk and to increase memory using standard PC SIMMs? Is there
>a limit on how much RAM I can have?

To hook up SCSI hard disks, you need a DMA->SCSI adaptor such as the
Link, from ICD, plus its accompanying software.

To increase RAM, Your 1040STfm will require a board to carry the extra
RAM chips/SIMMs (eg. Marpet Tech. ?) Which will allow you to go to either
2.5Meg or the full Monty of 4Meg. The 1040STe already has SIMM sockets
on the main board, but you're limited to 1Meg or 4Meg. I've seen posts
here which indicate that any PC SIMMs (256K or 1Meg) will work. Just
don't mix 256K and 1Meg SIMMs; it won't work! (This means you'd have to
discard the 256K SIMMs already in your 1040STe.)

Hope this helps.
Cheers, Steve

:
: ostruct.h:271: character constant too long
: ostruct.h:384: parse error before `volat'
: ostruct.h:384: warning: no semicolon at end of struct or union
:
: I also get these when just including (stdio.h>
:
: The header files seem to be intact, the zoo files are not corrupt.
: Where do I start looking for the problem.

Look into the ostruct.h header file, and check the lines specified
in the error messages. The messages strongly hint towards a trashed
file, if zoo doesn't notice any problem, a garbled version may have
accidentally made it into the zoo archive. 'shor' certainly should
be 'short', and 'volat' should be 'volatile'.
The errors also arise upon #including <stdio.h> because stdio.h
#includes <ostruct.h>.
You can also tackle the problem by calling just the preprocessor.
This is done with the -E option, i.e. you'll have to type something
like 'gcc -E hello.c -o hello.c1'. If -o is ignored and the output
goes to the screen, you'll have to redirect it to a file (I can only
hope you have a shell that can do that). With tcsh, use 'gcc -E
hello.c > hello.c1'. The preprocessor approach will also reveal
problems caused by crummy #defines that may lurk in other header
files. Such problems aren't likely to occur with systems that are
newly installed from the archives, but in principle a line like
'#define const volat' buried somewhere in the header files could
cause the type of trouble you describe.

I hope you can use this info.

David White (dwhite@rd.eng.bbc.co.uk) wrote:
:
: I was wondering, just how much could you alter the way GEM feels? For instance,
: doing away with the sizer box and using a system similar to Open Windows or
: even Windows. I assume that if a program is written properly you could have a third
: mouse button to activate the menu relavent to the topped window in it's own
: box. Why does GEM have to stay the same?

Regarding altering GEM, and window gadgets in particular, it should be
possible to change the appearance and the location of the window control
elements, and properly written programs should run under this altered
interface without any need for modification. However, adding functionality
is a different story. I cannot think of a method to do this without causing
any compatibility problems between old and new GEM versions.
It just occurs to me, though, that applications could be written to use custom
control elements in place of the standard GEM ones. E.g. a program could open
a GEM window without any sliders, arrows and sizer, and draw a Motif-like border
just inside the WORKXYWH of the window. Upon clicking in that area, it could
react in a Motif-like way by allowing the user to drag a corner or a border in
order to resize the window. Likewise, the program could set up custom sliders
that could then work such that the window contents are moved as the slider is being
dragged. All this stuff could be written in a library.
However, there are problems with such an approach: The programs written this
way would not offer GEM look & feel, yet they would coexist with standard
GEM applications, thereby possibly confusing users. Furthermore, such programs
cannot take advantage of further developments of GEM, and they might actually
have a strange appearance to the user under future GEM versions. So, this
might be a silly idea after all...
On a more realistic level, I think that GEM (or the AES, to be more specific)
could be improved by some extended configuration options, such as configurable
slider width, configurable font (for menus and window title/info bars),
configurable slider positions (the vertical slider/arrow elements could well
be on the left window border), and so forth.

2793. GEM Style Guide

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-26 23:21:43 UTC
From: ogal@cix.compulink.co.uk
Message-ID: <CqFnK7.D7t@cix.compulink.co.uk>
Source record: 32457

Hello GEM developer,

IMPORTANT ANNOUNCEMENT FOLLOWS

The GEM user interface has recently matured into a generally non-modal, multi-tasking environment. Thanks to many developers such as 2B (Mag!X), Gribnif (Geneva) and authors of many excellent GEM programs (mainly in Germany, but also in the US, UK and other countries) we now have a very nice environment to work with.

One of the main problems for users, which have been exprssed to me by many users is the lack of standards, or that there are too many standards. It seems the German programmers have got their keyboard shortcuts sorted, but some of their standards contradict the Atari Style Guide as published in the Atari Compendium and the developer docs from Atari.

Since Atari do not seem to be getting invloved in this area, it's about time that some communication started between developers across the globe. The Atari market is too small for too many systems. Both Geneva and Mag!X should maintain a high degree of compatibility, and authors of programs should do as much as possible to keep to the standards.

The problem is now to agree on a standard interface, and the first topic I would like to discuss is the issue of keyboard shortcuts. I have laid out a proposal for a standard and have discussed it at length on CIX - the UK main BBS for ST users/programmers. My proposal is a PROPOSAL, I do not wish to dictate my ideas. I just want a standard to work to.

I invite you alnog with many other developers to take part in this discussion. If we reach agreement, I will personally make sure that the standard is published in several ST magazines, placed on FTP sites and is also available in a printed form at a minimal cost to cover printing cost.

Yat Siu of Lexicor has been kind enough to allow use of his system to start a mail list for this purpose. I have to stress here that Lexicor do not have any 'special' interest in this discussion, although I am sure Yat will want to express his opinions just like everyone else. I urge everyone to put competition aside and to join the mail list. Once we got the keyboard shortcuts standardised we can look at universal implementation of the VA_START protocol, a FAX protocol, adding

menu items to programs (Windows style), enhanced GEM Clipboard
and anything else we think is useful.

The mail list is ready for use, once there are enough people
subscribed I will post my keyboard shortcuts proposal and
discussion can start. I already have incorporated some
ammendments suggested by Wilfried Behne (Mag!X, NVDI).

> of the receive buffer, so can it really be that the receive
> buffer is overflowing?

The problem could very possibly be due to the slow disk access. Since you are using TOS 1.0, writing to a nearly full hard disk takes a lot of time, and this could be causing the CRC errors. Your program probably flushes the buffer after 16K, explaining for the consistency of the errors.

Shazam! I was just about to post a question about this! The same thing
happened to me last night. I overfilled part.E and F was trashed "Unrecognized
boot sector". I read the two follow ups to this message but they didn't tell
me much considering I'm a computer idiot! :) Could someone please be a
little more specific on this problem.

thanks....Chris

What you are describing is an increase in resolution. You can only do this (in a usable fashion for work, that is) with a third party graphics card. These are quite expensive for the ST, and are often wrought with compatability problems. Also, I have only seen offerings for STs with internal card slots (MegaST, MegaSTE, TT). The Overscan mod is a nice compromise, and relatively inexpensive. It gives you more usable space by allowing you to use more of your monitor at the same resolution (a much easier task than increasing the resolution). The Autoswitch overscan is an even better Overscan.

So, some Overscan users want to comment? Does anyone have one working on a MegaSTE?

If so, FATspeed might be able to help. It is available from atari.archive.
However, I think it might be TOS 1.0's serial driver bugs that are doing
it. Upgrading to TOS 1.2, 1.4, or 2.06 and using HSMODEM should do the
trick. FATspeed is a must have regardless, given that a hard disk is in
use with TOS 1.0 or 1.2.

Not unless you replace the drive mechanism. Rising Star computers specialize in floppy work. Their number is 1-800-252-2787.

I have seen DSDD ST external drives for as little as $30 used on the net. Do yourself a favor and get one, it makes things much easier. Then, get yourself a hard disk. The increase in usefulness and productivity is significant.

There are some instructions for hooking up 5.25" floppies to the ST (for use with PC Ditto and the like) on atari.archive.umich.edu. It also has lots of information on floppies in general, and should help you with a 3.5" mech replacement. The file name is ibmfloppy.lzh.

> I also have a Seagate 157A hard drive. I am planning to use the

> Has anyone done this for this drive? Which of the adapters is the
> best for this rig.

I'm not familiar with the model, but if it is not embedded SCSI, I would suggest going that route. Having a separate SCSI controller for MFM or RLL drives (like an Adaptec 4050, for example) is a real pain and yields poor performance. SCSI drives are cheap, and lots of good used units are on the market. Check out misc.forsale.computers.

> Finally, I missed Dave Small's article on how to add a 5.25 IBM

Write them and email, and I'll put them on atari.archive.umich.edu (though
the null modem one could be summerized: Buy the right cable, connect, done).
Also, could you email me the "generic floppy drive" document you mention
above. I don't remember seeing it on the archive, and it sounds useful.
Thanks in advance.

That port can essentially be considered a SCSI port, so you could conceivably hook just about any SCSI device to it that way. Drives, tape drives, removable platter, optical, WORM, floptical, etc. The Atari laser printers use that port. There is an IBM emulator that connects to the DMA chain. There are probably other things that I am forgetting.

If you want to connect old MFM or RLL drives to an ST, you will need a separate SCSI controller (like an Adaptec 4050). However, embedded SCSI drives (those with an onboard SCSI controller, which is essentially all of them) will yield much better performance, and result in a less complex setup. SCSI drives are cheap (used units can be had for a song, and new ones are pretty low as well). The nice thing about SCSI is that you can always use the device on other platforms somewhere down the line. I have a "roll your own hard disk" file somewhere, if you are interested.

> replacement or do they just run the standard 8MHz 68000 at 16MHz?

The CPU is running faster than the rest of bus (in this case, double speed).
A fast instruction cache combined with a faster CPU will result in more
instructions being executed than with an 8mHz processor (the cache is
essential, because if it is not there the CPU will receive the instructions
at 8mHz, thus making the faster processor useless). So, the cache stores
instructions temporarily, and forwards them to the CPU at 16mHz, thus
allowing the CPU to stay busy in between clock pulses (which are going at
8mHz). Performace gain is experienced when the cache can stay ahead of the
8mHz clock.

There is a chemical whose name escapes me that might help. It comes in
red (strong, permanent) and blue (designed for components that might be
removed, like cables or SIMMs). It is not Loctite, by the way :-). Anyway,
this stuff eats off corrosion at a microscopic level, thus improving
connections. It has the side effect of making metal to metal contact very
"sticky", so chips walking out of sockets and cables pulling loose become a
thing of the past. So, if you paint a bit of this stuff on the connector
and reassemble, it is unlikely to move. This stuff is sold in various
electrical supply catalogs (I think Techni-Tool has it). It would also
be ideal for fixing the infamous 1040ST chip walking problems (often solved
by dropping the unit on a hard surface from a few inches).

Ah, wait! The name is Cramolin! Ha!

Hey Lars, if you open up your MegaSTEs, write down the GST shifter markings
for me :-).

You cannot radically alter GEM without patching it, which is hard because it
is in ROM (GEMRAM can solve this, but cause other problems). Another option
is to run an alternate desktop. I swear by Neodesk, even on TOS 2.06
machines. It is the best single-tasking GUI I have seen on any platform.
For task switching, one can use Geneva with Neodesk. It even has some
MultiTOS compatability features (I don't know about MiNT).

Yet another way is to compile applications with an alternate GEM libary, or
just write your own nifty routines. Enhanced GEM has flying dialogs that
perform similar to what you describe above (though the right mouse button
is used).

John Richardson (richardson@vaxr.sscl.uwo.ca) wrote:
> I am considering trying to learn to program in C this summer...or at least try!
> I have a program in BASIC that NEEDS to run faster! Anyway, a couple of
> questions for C programmers on the ST:
> 1) is trying to convert an existing program a good way to learn C ?

There is no good way to learn C :-). Transfering a BASIC program can be
done quite easily, given that you don't care about embedding goto's in your
C code. C is a tricky language to learn because it allows you to do just
about anything. You can write C code as you would BASIC or Pascal, but it
won't be as efficient as it could be (it is not unreasonable to not care
about this).

C's flexability also breeds a lot of confusion with coding styles. As a
C program becomes more familiar with the language, he/she develops an
individual set of "tricks" that might be very difficult for another programmer
to read and understand. Thus, just "knowing C" might not be adequate
preparation to work with a programming team, for example. With C, there are
a zillion tricks for everything.

> 2) what would you recommend as a good starters version of C ?
> eg. commercial, PD, SW etc.

If you mean for the ST, Prospero C is reputed to have the best English
documentation for both the language and the ST specific stuff (GEM, TOS,
AES, etc.). There are numerous good C books (and lots of terrible ones)
that are relatively platform independant, so just about any compiler can
be used. I usually use the classic K&R text that started it all. Also, I
like "C: A Reference Manual", because it is easy to look stuff up in it.
However, neither of these provides a good "start from scratch" approach to
learning C. As for compilers, touchie-feelie ones like Pure C and Prospero
C are a bit easier to work with than the UNIX style command line ones (GNU,
Mark Williams, most PD and shareware ones).

No. FAX modem capability is implemented with a special set of Hayes commands,
which are not provided on non-FAX modems. If any of the software modems
for the Falcon every get released, FAX capability could be added with
more software. Also, some modems are designed to accept firmware (chips)
upgrades to extend their capabilites (Zytel, to name one).

Probably not. The ST needs the monitor to sync to specific frequencies,
non of which are provided by the SVGA standard. You can use a Multisync
montior, given that it can sync to the rates needed by the ST (not all can).
A "magic box" is needed to do this, and to be able to switch from low/med to
high res.

The only hardware that helps is a new drive. You could just swap
the internal floppy drive and your NECFD1036A.

The ST157A is an IDE drive, so you need an IDE adapter for your
ST. This is an internal expansion; in most cases it includes
TOS 2.06.

Yes, you are right, i just checked the SunOS man page. I couldn't believe it, though, i always thought, just copying the stack should suffice.

But anyway, modern OS's (like Linux :-) use copy-on-write to avoid unnecessary copying, and therefore dont provide vfork() any more.

Still learning, Andreas.

I recently recieved 2 x 1M Simms from a PC installation friend of mine.
I removed my 4 x 256 SIMMS and replaced them with the 1 MEG SIMMS. On
switching on my STe nothing happened. Having tried all sorts of different
combinations of the 1 MEG SIMMS in the 4 SIMMS ports, I could not get the
STe to work, and had to relectantly replace my 4 256K SIMMS, when my Ste
(to my relief) started to work perfectly again.
Conclusions:
1. Either the PC SIMMS given to me were faulty, or
2. Maybe not all PC SIMMS are STe compatible.(I believe these chips have
different response rates or something like that).
Maybe someone can enlighten me.
Cheers,
Dave.

2814. UNIXMODE or minix partition

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-27 11:16:26 UTC
From: matija@BIX.com
Message-ID: <matija.770037386@BIX.com>
Source record: 32242

Several interesting programs runing under MiNT, especialy MiNT-Net mention that you need a MINIX partition to use them. However, the emacs manual seems to indicate that the correct setting of the UNIXMODE variable is sufficient.

So what's the story? Is it enough to set up the UNIXMODE variable and perhaps make a few links in mint.cnf, or do I really need to dedicate a whole partition to Minix?

I understand that minix now works on the falcon? Is there any size limit to minix partitions? I guess there is no chance of having access to such a partition when MiNT is not loaded?

2815. CDROM and SCSI questions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-27 11:24:25 UTC
From: mboom@mswe.dnet.ms.philips.nl
Message-ID: <1994May27.122425.131966@mswe.dnet.ms.philips.nl>
Source record: 32281

Hello,

I have two questions regarding CD/SCSI devices and was wondering if someone
on the net can offer any help.

1. I recently bought an Apple CD300 for my TT which works perfectly. When I
started to read the SCSI-interface specification, it stated that it was
not possible to read the raw audio data from a CD. But I remembered that
in the specification of the CD300 that it is possible. The standard does
not specify the command structure and data structure of reading raw audio
ofcourse. Does anoyone know how?

2. I want to write a CD identification part in my CD archiver program, and have
to send SCSI commands. I found a library, but the lowlevel
interface did only include the ST-DMA interface and not the TT-SCSI one.
Did anyone write a function to send and receive commands on the TT-SCSI
bus?

Thanx,

Marcel.

>it'll light up when CAPS is "on", otherwise it'll be extinguished?

The CAPSlock key is as all other keys on the ST. That means that the keyboard itself does not know if its on or off. The state is saved in a byte in the ST memory and can be tested with a BIOS-call.

If you have a ST with integrated keyboard you might do something smart (you could attach the LED to the extra ouput on the monitor socket and make a small resident program that checks the state and controls the LED). On a ST with separate keyboard you would need a cable too...

The easiest way is to make program that shows the CAPS status either in the upper right corner of the screen (rightmost on the menuline, where some program have their clock display) or at the bottom of the screen.

Yes - a nice piece of work.
Even nicer is the Myriad Desktop, which although not yet released (I beta tested it), was specificly designed for use under MiNT, and as such uses lot's of clever tricks (esp. on Minix partitions), like when a filecopy is done for lots of files, a copy process is spawned, then you can carry on while it does the copy in the background.

I'm using Lattice C v5.6 on a Falcon - TOS4.04.

I seem to have a strange problem.

I can't free() one of my pointers (it malloc'ed OK).
I'm also having problems with realloc().

What's going on ?

I'm not a novice programmer, and I can't see anything wrong with
my code - just lovely ANSI stuff.

So......

Is this a bug in the Falcon ? (very unlikely)
Is this a bug in Lattice C (more likely)
Or my program (quite likely!)
if so, are there any special rules to follow regarding
memory management on Atari computers.

Hope I'm not wasting your time!
(my C programming really is excellent)

There is an updated version of the Atari TCP/IP FAQ available. I have sent it to a.a.u.e, ftp.uni-kl.de, ftp.tu-clausthal.de and it should be appearing on other sites afterwards. If you do not have access to getting files across the net, send me mail and I will mail you a copy.

If you see anything that needs to be added please let me know.

Also please take the time to pass this information on to Atari owners that are not on the net.

Thank you all for you help and interest.

Indeed! I am looking at an AlberTT right now. It is a VME card for MSTE and TTs. VERY easy to install and it gives you 1024x768 in 16 colors, a rather compatible video mode. Also, Dover Research, the company which sells them here in the US, just dropped the price to $199! That's a REALLY good deal for a graphics card! Check it out!

Mickey> So, some Overscan users want to comment? Does anyone have one
Mickey> working on a MegaSTE?

I don't believe the overscan mods (and autoswitch) work on any STEs.

CH>string for an alert box:

BTW: There is a small utility called RSCTRANS on ftp.informatik.rwth-
aachen.de:/pub/atari/util (I think) that will make tranlsating ressources much
easier. It takes an original ressource file plus a translation table, and
creates a translated ressource file. All object etc. indices are preserved, so
the program needs not be recompiled.
If there is no translation file, RSCTRANS creates one where all strings are
initialized with equal strings, so you only have to fill in the translated
versions.
This makes translating ressources a lot easier, since you do not have to do
the whole work again when a new program (and ressource) version arrives.

Hi,

I currently use E-mail/UseNet News from work but I things may change ... ! If that happens - I want to be able to access these facilities from home on my Mega STe. I'm in the UK and so my first thought would be to buy a 14.4 kbaud modem and get an account on Demon. Some questions:

a) (UK users) Is this the best way to go ? or is there an alternative method. (I could well be in the London area - does this change things ?) I'd really like access to ftp/archie/that sort of stuff as well as just mail/news.

b) Demon needs SLIP software on my computer - I guess there must be some around, but from what I've seen it all requires MiNT. Is that right or can it be done without ? (I tried MiNT a while ago - 0.95 though - but it didn't seem to like the mouse accelerator I was using - something to do with illegal Gem calls I think ... ???)

c) Does this provide for using News/E-mail off-line - the only sensible way to go as far as I can see. If so, what news readers and e-mail programs are available for this sort of setup ?

Basically I guess I'm looking for a beginers (sp?) guide to connecting my ST to the internet. With that in mind I guess e-mail would be the best way - I'll summarise here if there's interest/enough information - but if you feel it's general interest, post away, I'll be watching ! ;-)

Many thanks - in advance as always,

Martin

That sounds strange - SCSI supports synchronous transfers, but I think the
standard says that it is optional and has to be enabled on a per-target basis.
I have not yet heard about a SCSI device that will *only* work in synchronous
mode.
Further more, synchronous mode does not make much sense on a slow device
with 150 - 600 k/s IMHO.

ML>-does TT's built in scsi port support the standard ?

I think the hardware can do synchronous transfers, but I think there is no
driver to support this.

One possible methode to make such a thing:

An AUTO folder program or so may be used with the combination of a
simple hardware kit. The software could (in the background) send
signals out from the MIDI/Serial or the Printer port on a few pins
depending on the status of the Caps Lock.
The hardware dongle outside would simply check the signals and turn
the LED on or off.

Yep, the GEMulator by Branch Always Software. It's a short slot card that fits in your PC (get the fastest 486 you can for best results) that comes with Atari TOS 2.06 plus sockets for other TOS versions, if you wish. Compatability is quite good although there is no support for MIDI, sound or joysticks (it is not a good solution for playing ST games on a PC). It's not perfect, but works well.

For more info, contact the author directly at darekm@microsoft.com.

Actually I have what is claimed to be a SVGA mono monitor running
in hi-res on my STFM. I got it from LAdbroke computing in the UK complete
with 9-pin to Atari adaptor. They don't sell the adaptor separately,
and I havn't dissassembled it (yet) but it adaptor is very small so I doubt
there's much to it. You have to make sure your SVGA monitor is of correct
spec (I have the spec at home if you're interested mail me).

But it's still ridiculously heavy to use the PMMU in order to just execute
another program concurrently (fork()/exec()) which is the most common use
for fork() in *IX. Make an exact copy of the running process -- what for?
To be overlaid with another process, the requirements of which might be
totally different, say half or double the memory! Note that most prominent
*IX derived real time operating systems like QNX or Plan 9 use different
methods for achieving multithreading, eg. a fork() with a mask describing
which resources to be duplicated. Better still would be a new function
(say create_proc()) which would have the same semantics as fork() + exec() but
would do it in a more efficient way.

The one I've tried was called CAPSLOCK.ACC, logically enough. Unfortunately
it caused a lot of my programs to hang or otherwise screwup so I dumped it.
Maybe there are other versions out there that work better now. The best
solution, of course, would be a simple hardware mod to activate an LED on
the keyboard when the caps lock key is engaged.

Instead of going through all the hardware hacking, check out the
program LEDPAN25.LZH (or latest version, whatever that may be). It does
a couple things, including showing graphically all disk accesses,
the time/date, and the state of various keys (CAPS being one of them
I think). Well, it's worth the small download to try anyways...

I think Ledpanel only works in ST modes (all 3)...

Hope this helps...

Yup, great program. It is available at atari.archive and other
FTP spots, as well as on GEnie, etc...

I have found it to be quite helpful when compiling things - because
you can see where it's looking for it's files, where it's writing its
files, etc. Between that and FUJITT (or whatever the name of it was)
that displays the spinning fuji, at least I can tell if my computer
is still alive or gone to sleep :-)

Fax uses entirely different data protocols, different frequency bandwidth on
the phone line, and different coding methods. You could send data on Fax
(although, for technical reasons, that would be kinda weird), but not the
other way around.

2846. Falcon Newby problems with zoo 2.1, floppy formatters, audio out

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-27 18:32:45 UTC
From: patmc@ch.apollo.hp.com
Message-ID: <CqH4uL.2rq@apollo.hp.com>
Source record: 32244

Hi,

I recently got a Falcon and have run into a few problems that I haven't
seen mentioned here.

1. Zoo problems
Zoo v2.1 crashes with 2 bombs whenever I try to extract or list the
contents of an archive. Zoo v2.01 works, but unfortunately most of
the stuff I have is archived with v2.1 high compression, which v2.01
can't handle. Interestingly, v2.1 can "test" the archive, and can
do the extract with the "write nowere" option set, so the crash in
extract seems to be related to writing the uncompressed data to a
file. I tried this with the destination being both a floppy and a
hard drive, I think I also tried extracting to a ram disk.
Is there some kind of compatability mode that will make Zoo v2.1 work, and
if so how do you invoke it?

2. Floppy drive formatters
format71.acc, a formatter that allows writing up to 82 tracks and up
to 11 sectors per track, fails at the very end of the format when it
tries to write the boot sector. This error happens with all track
formats and sectors per track settings. This was formatting a standard
800K floppy, not a 1.4 Meg floppy.
DC Format also gets an error when writing the boot sector.
The desktop formatter has no problems.
Why can't other formatters write the boot sector?
Does anyone know if the Falcon floppies generally have problems with
going past track 80, or can't handle more than 10 sectors per track?

3. Audio output volume problems
My Falcon came with an internal speaker, which surprised me. The
initial volume is ridiculously loud (and also distorted) - the keyclick
alone gave me a headache after a short while. The audio output which
goes out to the monitor (an SC1224) is way too quiet - with the volume
on the monitor turned all the way up you can barely hear it. The
headphone output is like the internal speaker - it is at a level that is
almost damaging to the headphones, and such that you can't put them on
your ears. I saw when I bring up the audio part of the control panel that
the volume is initially set to maximum, which is definitely part of the
problem. My preferred method of using audio on the STE was connecting the
stereo RCA jacks to my mixer, but I don't want to risk hooking up the
Falcon headphone out to it until I know something about its specs.
The best thing about the internal speaker is that it is very easy to
disconnect - open the case, pop the speaker out and unplug it.
Is everybody else's Falcon audio outputs like this?

Am I missing something obvious?

Thanks for any help,
Pat McElhatton

2847. Albert TT info...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-27 19:03:16 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.94May27150317@wpi.WPI.EDU>
Source record: 32267
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

OK, since some people seemed interested from my post:

The Albert TT (or AlberTT) is a VME graphics card for the MegaSTE and TT. There was a version called ISAC which is a Megabus card for the old megas as well.

It does ONE SINGLE resolution: 1024x768 in 16 colors. Older cards could do 800x600 in 16 colors if you wanted, but not both, and Dover no longer sells the 8x6 version...

It seems pretty compatible, from talk on GEnie and a recent article in ST Informer (March 94).

The guy from Dover recently posted to GEnie that he had reduced the price of the Albert TT to $199. It used to be $299 and the ISAC (if they have any more) is still $299.

It requires a multisync monitor capable of "48hz vertical scan rate" and 17 inches is reccommended.

Dover Research can be called at: (612)492-3913

I haven't bought one yet myself 'cause I'm looking for a monitor first! I can't vouch for any of this info being true. It's just what I have read on GEnie and in ST Informer.

I am thinking of getting a good multisync and building either an automatic or manual switchbox so the Albert TT and the MSTE's internal video both go to a single monitor. We'll see...

Martin,

Why don't you just join CIX? It cost 25UKP as a one off charge and
between 4 & 6 pence a minute connection charges, with a minimum charge
of 6.25UKP per month. It gives you access to internet i.e.
ftp,email,archie etc. and you it is in London so it is a local call.
Talk about having all your prayers answered! :-)

Simon Robins (srobins@cix.compulink.co.uk)

I want to get a multisync monitor for my MegaSTE.

I want one which is flexible enough to handle ST low, medium, and high
as well as the output from a graphics card (the Albert TT) and
possibly even a VCR or Jaguar...

In other words, I want the perfect monitor.

Can someone please help fill in the question marks on this list or
suggest what to look for in a monitor? thanks!

mode Vert Horiz res. signal type
AlbertTT 48hz ? 1024x768 ?
ST Low 50/60hz ? 320x200 ?
ST Medium 50/60hz ? 640x200 ?
ST High 70hz ? 640x480 ?
Jag?
TV?
PC?

thanks again!

I used to hate GEM, now that I've got MagiX I love it!
I'm still running MiNT though (on top of MagiX), but the MTOS-AES
(AES 4.0) has been definitely removed from my harddisks. The main
disadvantage of MagiX is that it doesn't support extended filesystem
drivers (?yet).

%(i) Make sure you have the sharable versions of the MiNT libs in /usr/lib
% (or where ever you have your libs) and compile with the -mbaserel
% -mpcrel flags.
%(ii) Many programs won't link properly as some the references become greater
% than +/-32K.
%==

%(i) Since the libs reference data through a register, and registers are
%"obviously" per-application, then it follows that MiNTLIB in -mbaserel form
%could be used as a DLL type of library, right?

Almost. Currently the baserel implementation is such that data is referenced
at fixed offsets from the base register. The offsets are resolved by the
linker. Two different programs will most likely have a common variable, such
as errno, living at different offsets within their respective data spaces, and
so they cannot share a baserel library. In order to fully support library
sharing, you have to use the PIC mode which is already in GCC, but which still
needs to be extended to work on a 68000 ST. In PIC mode, the base register
points to a table, and each table entry points to the address of the desired
symbol. Every complete shared library requires its own table, and the compile-
time linker uses the table offsets. The dynamic runtime linker then fills in
the actual table entries based on the currently configured library. This is all
quite nice on a system with an MMU, but on a plain 68000 more complications
arise. The way PIC is currently support in GCC assumes the use of an MMU; the
system maps the table into memory right before the text address of the library
itself, so every routine in the library can use PC-relative addressing to
locate the table. Lacking an MMU, you need to use yet another base register to
point to the table. That's not so bad, but then you need a scheme to insure
that the correct value is loaded into the register prior to calling each
library routine. And, making matters worse, you need to make sure that
library routines that call back to the user, or that call into other libraries,
load the correct addresses before making those calls. This part is really
tricky, I haven't hit upon a good way to do it yet. Also, the optimizer starts
to really choke when you start eating up too many address registers for fixed
purposes.
%
%Obviously this would require extra support programs, and it could be better
%to just statically link everything for speed, but if the calling procedure
%were fast enough, having the libraries REALLY "shared" could ease up on
%memory requirements. Also, I don't think -mpcrel is required, is it?

No, -mpcrel isn't required, it's just a minor optimization that's nice to have when it works. In the future I will take this option away, and just have the linker automatically perform all PC-rel optimizations wherever possible.
%
%(ii) If you use an 030 and the -m68020 option, then this limit shouldn't %exist. I'm not sure if the compiler supports it or not, but the 020 and 030 %can do 32 bit offsets.

Back to the other point - baserel is certainly a good jumping off point for doing shared libraries, but it's still only a starting point. And when I first conceived of it, it was *only* as a space/speed optimization for "small" programs. It was only thru working with it as time went on that it's come to be as significant as it now seems. At any rate, while 68020+ support 32 bit offsets, and this gives you more position independence, you sacrifice the speed and space savings that 16 bit offsets provide, which was the original reason for all this to come about.

Meanwhile, it's back to the SVR4 68000 ABI to figure out what else I can do with the object file format... I'm thinking about abandoning the old a.out format for .o files, and going to ELF. ELF provides a lot of cool benefits, but unfortunately isn't all that well-supported by the GNU tools yet. (Some of the nice things about ELF - it stores the size associated with every symbol, so your linker can grab individual routines and such instead of always linking in an entire .o file just to resolve 1 symbol.)

2857. Re: For the hardware specialists (and the others too !)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-28 01:32:06 UTC
From: ekl@sdf.lonestar.org
Message-ID: <CqHo9K.2Bt@sdf.lonestar.org>
Source record: 32287

Well, speeding up the computer through RAM is always impossible on the ST since all RAM access goes through the STs MMU which is hard coded for 8Mhz - so it's locked into a speed of 120-125ns or something. Since the CPU can't access memory every bus cycle (CPu needs minimum 4 clocks to do anything), the video can take the bus cycles it needs when it needs them and will never slow down an 8Mhz 68K.

One idea: There DO exist sources for drivers to handle QIC-80 tape drives that are publicly available. They're available with various of the free versions of Unix available on the Intel platform. These drivers will obviously be a good source from which to determine the commands. Moreover, the drivers might represent a good code base that actually manipulates the data.

I'm not sure that they handle the parallel port implementations; the stuff I've seen documented has only been clear about the support of floppy-interfaced versions. Nonetheless I would be highly surprised to hear that the tape drive manufacturers build distinct tape drives for these applications. Any command set should translate fairly easily.

Hope this is helpful.

For what it's worth:
One of my friends had some intermediate crashes on his Mega STE, which would disappear when in the 8 MHz mode. I suspected dust... we opened the machine up and gave it a good cleaning. No problems since, except for the usual TOS crashes once in a while.

But HSMODEM2 and HSMODEM4 perform adequately at 19200 on an 8MHz Tos1.0.
This is what I have and I have been using it successfully for ome time.
I agree that you cannot go any faster than 19200 on an unmodified system
(unless anyone knows anything different).

How's that? _ANY_ C++ compiler is going to be slow (especially on an
ST) and memory hungry.

A cross-compiler on a fast UNIX machine (even one with terrible
floating-point performance) makes it sweet.

No the 110volt PSU is not the same and can't be changed, that is from the early
STFM that were sold here..

Most Switch mode PSU do have that option to just snip a wire to convert it to
240volts, but Atari PSU's are made to a price....!!

All the later 240volt PSU have no option for them to run at 110volts...

There are firms in the UK that sell 240v PSU's....

> to Minix?

Bammi's GCC TOS library is the only library that supports non-8.3 (long)
file names on TOS partitions (i.e., knows about the corresponding UNIXMODE
flags).

However, many programs designed to work with MiNT now use the MiNT library
which rather relies on the underlying filesystem to provide long file names.

So to make use of programs which need long file names and are not linked
against the TOS library, you'll need to set up a Minix filesystem.

> I understand that minix now works on the falcon?

I guess so. (I've heard of problems with Minixfs 0.60 PL 9/10 + MultiTOS,
but this is now being worked on..)

> [...] Is there any size limit to
> minix partitions?

That depends on the hard disk driver you use. For details, you should
read the documentation that comes with the Minixfs source distribution.

> [...] I guess there is no chance of having access to such a
> partition when MiNT is not loaded?

Under TOS, no.

(My understanding is that (some?) Minixfs file systems can be read from
an operating system called Minix (that's where it originated), but I guess
that Minix doesn't run on the Falcon. :)

> anyone offer any advice on configuring HMODA4 or any other patch to
> increase my effective throughoutput?

This may work for you, it works on my 1Mb 1040STF TOS1.0:

These are my answers to the Setter program:

FASTINT: Y
RSVE: N
HISP: N
REPL: u u u u u u
DTR: Y
RBL: 4096
TBL 4096

This will give me around 1900 cps on text and about 1600 cps on compressed
files (I use a V32bis Dtaflex Rapier+ modem).

For the REPL response, you can either type all 6 'u's in response to
Platz 1, or type a 'u' to each Platz question.

Best of luck...

Source record: 32424
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have unsucessfully for some time been trying to get my MegaSTE to work
at 38400 or 57600 bps with my SupraFaxModem. I have recently discovered
that Connect 2.46 lets me set both these speeds when using serial 1 or
modem 2. I have tried, sucessfully, to use 57600 on serial 1. The problem
is that while this speed appears to work with connect on serial 1, all other
programs which I have only seem to work on modem 1. Is there some way to
force programs to use Serial 1? If so, is there a way to lock the speed
on serial 1? Is there any other way to obtain 38400/57600 bps on a MegaSTE.

Please reply by email to ggford@cuug.ab.ca

Thanks.

Perhaps try 'Communication Manager' ("Coma") which is a
shareware package and apparantly offers other things in
addition to FAX. The unregistered version of the shareware
package sends a maximum of 500 lines per page.
Being a German package, the docs. are in German but the
dialogues are in English if the box "Deutche Meldungen" is
clicked to remove the 'X'.
I saw version 2.02, which may be the current version, in
ftp.cs.tu-berlin.de /pub/atari/Modem coma_202.zip (247955 bytes).

I haven't actually used the package myself but I'm planning to
do so soon. Perhaps someone who is a user could comment further?

[stuff I wrote about modifying 240v PSUs for 110v]

sheppard_r@ix.wcc.govt.nz (Roger Sheppard.) writes:

>No the 110volt PSU is not the same and can't be changed, that is from the early
>STFM that were sold here..

But what about elsewhere?

>Most Switch mode PSU do have that option to just snip a wire to convert it to
>240volts, but Atari PSU's are made to a price....!!
>All the later 240volt PSU have no option for them to run at 110volts...

Fair enough, mine is 1987 vintage so I guess that's why it was so easy.
Still, it wouldn't hurt to look if you were in the situation of having to
move from 110v -> 240v or vice-versa.

[my small untruth about mixing RAM sizes deleted]

>Not True, 2.5 megs will work on a STE, I have had only one piece of software
>that did not run.....??

On re-reading what I wrote, I must have been half-asleep. In future I'll
avoid posting 1st thing in the morning! ;-)

I was most disappointed when I tried to get ORCS to save in a format other than it own `RSO' format. The buttons are there for all sorts of formats, but enabling them has no effect!!!!

I ended up putting all the object and form labels in by hand (thank goodness for MultiTOS, so I could have ORCS and Interface opened at the same time).

Huh? That has no effect on GEM. GEM is the windowing system, not the
Desktop program you run. An alternate desktop doesn't change the
look&feel of programs run from it.

I have also tried CoMa with a ZyXEL 1496E modem, and I managed to receive and even send faxes. The answering-service didn't work though, since I don't have more than 19200 bps on my old ST. I thought it was neat though...

CEO file contents:
Hi all,

I asked these two question last week but only got one reply. Come on, these aren't hard ones :) So here we go again :

A) Is there any way to read Macintosh disks and files (simple plain vanilla ASCII, I'm not _that_ optimistic) without buying Spectre ? BTW what is Aladin ?

B) I found a shop selling use 32bit 1Mb SIMMs for cheap. At the moment I have a 520STE with 1Mb (4 x 256Kb SIMMs). Can I use these 32bit SIMMS to get 2.5Mb ? (they are about 20$ each) I know you can use 8 or 9 bits, but what about 32bits ?

Thanx again,
Nick.

Well I get some 1600 CPS with Archived files, and from what I have seen posted
in the modem group, you can't get faster than that..

This is with a DTE speed of 19.2....

Unless you are running a lot of Text there is no need for a faster port speed..

I have connected my SVGA monitor (50-100 Hz vertical and 3 horizontal
scan frequenties) to my ST in hi-res. Just wire the mono-out from your st
to red, green and blue in on your SVGA monitor and connect the mono detect to
ground. Of course you must connect h-sync and v-sync too.

>I think that time is lost.
>Please tell me if I am wrong, I don't want to live anymore as an idiot !

8) Yes, you are wrong. Usual misconception - memory speed determines
how fast you can drive it, not how fast it goes all by itself.

(not to mention that you would have to add address decoding, DTACK
generation and lots of other hardware to make this memory work, and even then
then operating system wouldn't recognise it.)

The ST doesn't actually lose any cycles (that I've seen) due to refresh,
as it uses a 'hidden' refresh technique.

No, you can't re-load the file back into ORCS, because Interface saves
resources in the new RSC file format. When ORCS loads it in, it tells me
that the resource files ISN'T a resource file, and I am unable to load
the modified file into ORCS (hence, I've been forced to use either ORCS
or Interface).

From: gbernath@oucsace.cs.ohiou.edu
Message-ID: <Cqn8po.Lto@oucsace.cs.ohiou.edu>
Source record: 32439

I've recently acquired a 1040STe that won't print. The printer and cable work fine with any other computer.

The computer does recognize if the printer is disconnected or turned off, and gives the appropriate alert box. If there is a printer on line and you tell it to print, the computer does a disk access like it would normally do when sending a file to the printer, but nothing else happens.

Is the printer chip blown? If so, which chip is it that has to be replaced? (Please be nice and tell me it's one of the socketed chips, so I don't have to beg more favors from someone who's capable of soldering on a PCB).

I had the same thing happen to me. AHDI is bugged in versions 6.0.5 or
whatever and below where it trashes the same thing. Just get AHDI 6.06l and
you'll be right - no more trashing of bootsectors.

Karl.

2908. Re: CGA Monitor Question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-31 02:10:15 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JU7OObf.lmcclure@delphi.com>
Source record: 32436

In a message dated 5-21-94, Pauline Higa said:

"My question is quite simply, can you hook up a CGA monitor
to a STfm... and would it be worth the effort in the first
place?"

Yes. You would need to invert the horizontal and vertical sync outputs from the STfm, as most CGA monitors expect positive sync, and the ST outputs negative. Some CGA monitors will accept either however, either automatically or via a switch.

Once this is done, connecting the RGB lines to the same on the CGA monitor's input port would result in a maximum of 8 colors...meaning most text applications would function decently, but many games and graphic aplications would look horrible. Note that you would either tie the "Intensity" line of most RGB monitors high to a 5 volt source for maximum brightness.

In other words, it could be done, but for most people, would not be worth the effort (i.e., if you could afford a used SC1224 or SM124).

All,
So, is it, or is it not, possible for me to acchieve 57.6Kbs transfers through a 'standard' 14.4Kbps modem while using built-in MNP error-correction and data-compression?
I have an unmodified Mega St4 (no "E") and have installed HSMODE04. I do not know if I have installed it correctly though. What HSMODE04 files do I need in AUTO and are the "y, n, n, uuuuuu, y, 4096, 4096" settings suggested earilir sufficient to get to 57.6Kbps?
Please help! I've seen this rate done on a friends PC with an internal card 14.4 modem and would _really_ like it here at home on my _more expensive_ INTeL modem! :)
Thanks a bunch!

2910. Bugs in Mint Lib PL 44?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-31 03:52:14 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <2sec9e$9ca@geraldo.cc.utexas.edu>
Source record: 32291

Hi, I have encountered what appear to be a couple of bugs in the mint libraries (PL44) and include files. I would like to know if anyone else has encountered them and if there are any fixes. I have used various versions of GCC and the mint libs for years, and have never encountered these problems until now (upgrading from PL 30).

1.) The getcwd() library routine does not return a sensible directory when MiNT is not active. It does, however, work fine with MiNT. Under plain TOS, any directory, like f:\gs is returned by getcwd() as f:/dev/f/gs. After I found this behavior, I tried to restore my old libs, only to find that I had accidentally overwritten them. The oldest libs I could find on the net were PL39, but they display the same behavior.

I find it hard to believe that this bug could have gone unnoticed for so long. Has anyone else seen this?

2.) osbind.h defines AND_MEMORY to be "memory", and then uses this "memory" regigster in some GCC inline assembler. This causes my GCC 2.2.2 compiler to choke (I tried 2.5.8, but I run out of memory with 4 meg -- had to revert to the older version). To compile anything, I had to define AND_MEMORY to be nothing at all. This quirk was also in the PL 39 include files. Does anyone know whether this redefinition can cause any problems?

These problems are all that keep me from uploading an alpha version of the new Atari interface to Ghostscript.

Thanks for any help,

-Tim Gallivan

The STE is a 16 bit buss machine, and the Ram is split into 8 bits, for byte
access..

You need 8 bit SIMMS, or mod the STE to use 9 bit SIMMS, the unused 9th
bit must have the inputs terminated to 0v or +v, so just connect pins
28,29 and 30 together....pin 30 is +v....

Let me add another bug: Reading integers in hexadecimal format e.g.

scanf("%2x", &i);

does not work properly if the hexadecimal number starts with a zero.

This doesn't look hard to fix, so if nobody has done this I will give it a try.

Richard.

You can safely remove "memory". It tells GCC that the assembler instructions clobbers some memory references, and i thought it was supported by all GCC version after 2.0. I'm quite sure that it is supported at least by 2.3.x.

>>anywhere close to GNU C or Lattice C

It's possible to persuade gcc to produce output suitable for QDOS (and
thus for SMS2) but at present the C68 libraries need a bit of work.
However, you need fairly substantial resources to run gcc at all...

>I must definitely flame this, c68 available for QDOS and SMS2
>is very small (.i -> .s phase about 110K) full K&R and ANSI
>and some extras (printf format string checking ....)
>AND FULL sources and extensive libraries(curses,regexp ....).
>AND FREE
>AND ALL relevant GNU utils ported(except gdb, this is a real
>drawback)

Hmm. GNU Make is a relevant GNU utility which AFAIK hasn't been ported to
QDOS/SMS. (Picky, picky...) Porting gdb would be nontrivial.

>The library makes great effort to make porting unix programs
>easy, only differences are in fork/exec and this is much more
>comprehensive under QDOS/SMS2 than unix.

I'd very much like to hear what you think is missing from Unix in the area
of multitasking support that QDOS/SMS2 has.

>Xwindows is not ported, nobody attempted to make it work with
>a QL (<2Mbytes in the vast majority).

I shouldn't imagine an X port is very likely.

>Otherwise it should not be a problem.
>
>The provided window system is very easy and extremely effective
>to use - makes intelligent use of the keyboard, pointer/window
>placing strategies etc..

Provided the programmer is intelligent, just like with GEM and any other GUI it's easy to produce hideous and botched programs.

>>> How similar to Unix is the multitasking?
>
>c68 libs make it appear very similar,

Err, I'd say they make it appear fairly different, actually. Look up what fork() is supposed to do on any Unix system and then say c68 does anything remotely similar. The exec..() calls all take extra parameters in the C68 libs that aren't required by the Unix versions. Also there's no signal support as such, and signals are quite important to multitasking under Unix.

>otherwise very different,
>extremely fast job-switch (about 0x68 bytes context information
>under QDOS)
>
>>IMHO don't bother. I've had a bit of experience of standard QL QDOS
>>(which as I said I *believe* SMS2 to be an enchanced port off, and in most
>>ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
>>be its compactness and efficiency.

If you _already_ like QDOS and have an ST (for whatever reason) then you probably should bother. Otherwise, if you want a fast, compact multitasking system which, although it can't run TOS/GEM programs does already have a software base, you might be interested. You'll have to get used to another way of doing things, but, no pain: no gain.

>some advantage is the THING system.
>A THING is an named block of memory - or object, depending

>
>THINGS may contain system extension, executable code,
>shared data or something else and may provide their
>own init,cleanup etc routines.
>Extensions in things may also use a very sophisticated
>parameter description/checking

Currently Things are most widely used for supporting resident programs and a standardised format of extension (i.e. a kind of shared library.)

>This provides fairly sophisticated and fast job communication
>without such overhead as with REXX or similar.
>
>In my view the biggest difference between QDOS and SMS2

>on the one hand and UNIX,MINIX,MINT on the other side is
>the resident program concept of QDOS/SMS2, that means
>shared code of program instances, but also requires
>reentrancy of the programs.

Modern Unix implementations are quite good at code-sharing too. However,
you need extra hardware to perform the particular trick I'm thinking of
(i.e. a MMU.)

>QDOS. It may be an alternative QL O/S, and it is *slightly* compatible,
>but thats all.

If you look at the system call interface for SMS2 you will find large chunks of it are essentially the same as that of QDOS. Hence it will run some QDOS programs. However, it is not a QDOS port in that the underlying operating system does many things in completely different ways. (e.g. the job control block is somewhat different.)

If you want QDOS running on an Atari ST, that's possible as well, though you need an extra bit of electronics to emulate the Ql's display modes for this to be useful.

SMS2 users will want to know which QDOS programs they can use. The answer is: some. One can divide QDOS program into three categories.

1) games --- you can be pretty sure that what QDOS games there are won't run under SMS2.

2) old-fashioned programs --- programs written many years ago, or programs written as if they were written many years ago. Many of these won't run under SMS2 because they makes invalid assumptions about QDOS. (That may sound odd, but it turns out that they won't work under certain versions of QDOS either.) This sort of program is becoming rarer and rarer, but they're still around.

3) modern programs --- usually easy to spot since they use a GUI interface very similar to that found under SMS2. If you have one of these then it's quite likely that it will work under SMS2 as well as QDOS.

The acid test, of course, is to try the program in question and see; though that's a bit annoying if you've paid money for it and it doesn't work...

Not very good expressed myself. I wanted to say that usualy
fork/exec on QDOS does what several lines of code do in unix
Of course there are things you can not do with C68 fork.

>>Xwindows is not ported, nobody attempted to make it work with

I am working on the signal stuff now, maybe it would work
on SMS2 without many changes.

There is of course the old TOS emulator for QL Dave used
for porting the C compiler, only very well behaved
TOS programs could use it

Bye

It is certainly 'illogical':

CMY = GB BR RG
RGB = MY YC CM (?)

(you can put the colours in a hexagon GCBMRYG etc.).

So you'd need unbalanced combinations (not 50-50, but 30-60 and
such) to get B,M and G if you have CRY.

Hello!
Is there a program availible were i can mark a sector on my Harddisc as bad
MANUALLY?

I have a sector (sec 9008) on one of my harddisc that is beginning to get bad.
F.ex Diamond Edge is telling my that the sector is bad but it wont MARK is at
bad. It just "fixes" it.. Then the Harddisc work great for a month.
But suddenly the "Data on drive C can be damaged" window pops up again and i
have to run Diamond Edge to "fix" the sector again.

I cant wait for the sector to get so bad that Diamond really MARKS it as bad in
FAT. Therefore i wonder if there is a program availible that works like this:

Mark a sector on your harddisc as bad ? Y/n
What sector ?

Or something like that.. I dont want to dig in FAT without knowing what i do..
;)

Plz answer in an E-mail.

PS.. Its an RLL drive.. So you dont have to suggest ICD stuff ..DS

> Thanks a bunch!

No, not without hardware modifications (I remembering seeing a section of
the HSMOD docs that seems to indicate otherwise, but I think it is just a
translation mishap). HSMODA0x does at least three broad things:

1. Fix TOS bugs having to do with hardware flow control (RTS/CTS).
2. Optimize serial driver routines to obtain more performance from
existing hardware.
3. Support RSVE, a hardware modification that allows faster speeds than
19200 on ST ports. I believe it can also be made to support other
hardware speed mods, though it is not guaranteed to work.

You simply cannot get more than 19200 baud _reliably_ on a stock ST/STE
without making hardware mods. The good news is that the hardware mods are
not very difficult, and that there is soon to be a commercial product to do
this that should be very easy to install. See my other (big) post on
modem stuff for more details. Hope that helps.

> force programs to use Serial 1? If so, is there a way to lock the speed
> on serial 1? Is there any other way to obtain 38400/57600 bps on a MegaSTE.

Yes. First, you can select which serial port maps to "modem 1" with the
xcontrol panel (the CPX needed should be included). Then, you can use
HSMODA04 to map 57600 to whatever "standard" baud rate you want. In other
words, you would still select 19200 or whatever, but it would really be
57600.

However, I personally find Connect to be superior to Stalker. There is a
lot to the program that is not immediately apparent (you need to read lots
of help pages, or register it and get the manual to find them). With
NVDI, and my MegaSTE set to 16mHz, it is very nice indeed. Just my $0.02.

2934. Help with Mouse

Newsgroup: comp.sys.atari.st.tech
Date: 1994-05-31 16:11:37 UTC
From: <>
Message-ID: <2sfnjp$j9r@news.CCIT.Arizona.EDU>
Source record: 32303

Hi tekkies!

I am in need of some advice. I am new at programming GEM applications in C, and I could use some advice in getting the mouse to work correctly:

It was no surprise to me that if you change the background behind the mouse, and then move it, the mouse replaces the original background... This makes sense, and most people remove the mouse before accessing the screen and then put it back.

But then.... I brought up the fileselector tool... the one that most programs use without incident, and the problem was there, too! Completely beyond my control, if a person double clicks on a directory, say, then the list of files is replaced with a new one. But, upon moving the mouse, it drops the previous background! So, traversing through directories on the file selector mucks up the listing with garbage!

So clearly I am doing something wrong. How can I make the mouse work with basic GEM elements? Why is it NEVER informed of background updates, or removed prior to screen access by the OS? I have played with both VDI and AES calls, and still no luck.

Your help is greatly appreciated! Thanks in advance!

Jeff

P.S. Please email any advice to me as I don't get to access the news that often. Thanks again! :)

So it would be possible for me to go out and buy a SCSI drive and hook it
direct to the DMA port on my 1040ST ? I'd be interested in the "roll your
own guide". Thanks.

Are there PD drivers available for ST/SCSI drives ?

Steve

In a message dated 5-31-94, Roger Sheppard said:

"NO NO, a CGA monitor will not work on a ST/STE....."

Would you mind explaining why not?

I have known of other computers with RGB analog-only output (such as a Tandy Color Computer 3) being used with RGBI monitors (with the total number of colors limited to 8 instead of its usual 16 out of 64), as well as others.

If the RGB analog outputs of a CoCo 3 are "high" enough to trigger the gates on an RGBI monitors inputs, the "hotter" output of an Atari ST certainly should have no problem.

In fact, if someone out running their ST on a Magnavox 1CM135 cares to switch the switch from RGB analog to RGBI mode, I am certain they can solve this quite quickly. <grin>

You should try to sell the Mag and get a better one. I have a Hantarex
Crystal Multisync (30-48, 50-90) and it doesn't flicker at all.
It can display the extended true colour res.

The demo of the screenblaster is without the hardware clock, so
the screenblaster is able to give you lots of resolutions (some
with litle interlace). I even got 1280x960 (on a SM125!!).
I here the screenblaster 2 is out and you can set your own resolutions.

Date: 1994-06-01 03:39:02 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5u+uuBe.lmcclure@delphi.com>
Source record: 32351

In a message dated 5-31-94, SPERNA1@ua1vm.ua.edu said:

"I dunno I think more than a few Atari users would go for an
inexpensive hack to get 1.44 or 2.88 floppy drives ($100us)"

I recall someone from Atari (Sam Tramiel?) once mentioned that the Ajax
disk controller could handle 2.88meg disks "with some extra circuitry".
I wonder if that "extra circuitry" could be as simple as a 32Mhz clock
instead of 16Mhz? (It should not hurt the chip to try...it is supposedly
rated for that speed).

2950. Re: SCSI floppy controller on STe

Newsgroup: comp.sys.atari.st.tech

Source record: 32345

Oddly enough, I know of only two "mainstream" machines you can easily buy
2.88meg drives for: PC compatibles (of course), and (surprise) the Commodore
8-bits (the CMD FD-4000). Of course, the first flopply that went into a
NeXT was a 2.88meg unit, but I would not exactly call those "mainstream"
(and would not have even when they were being sold).

2951. Atari Breakdown?

Newsgroup: comp.sys.atari.st.tech

From: lordthan@news.delphi.com
Message-ID: <2sh59h$h2a@news.delphi.com>
Source record: 32318

Can someone please MAIL me a list of the general specs of ALL Atari 680x0-based computers? I'm specifically looking for the following specs throughout Atari's past and present 680x0 computer line:

* CPU type (680?0, with or without math coprocessor) and clock speed
* Port configuration
* Expandability
* Included "options" (i.e., RAM setup/maximum, hard drive, floppy type, what sort of monitor it can use, etc)
* General design (all in one unit, seperate keyboard, etc)
* TOS versions (i.e., what version of TOS the machine comes with, as well as how far you can upgrade it -- such as putting TOS 2.x ROMs into a 520ST, for sake of argument)
* Any other sort of pertinant and/or interesting information.

The reason for this is simple. Now that I've gotten my old 8-bit Atari up and running to capacity (soon to be set up as a BBS), I want to do the same for my old 1040ST (with the emphasis on "old"). I *think* it would be easier just to get rid of my 1040ST and buy a new 680x0 based Atari to run the BBS (and other stuff), but since I've been out of AtariLand for so long, I really don't know what's out there.

Oh yeah...Insight towards expandability for each machine (i.e., how easy/difficult it is to add RAM, accelerators, or other "add-ons" that would normally be done with a card (or cards) on PCs and Macs) would also be appreciated.

> Please help! I've seen this rate done on a friends PC with an
> internal card 14.4 modem and would _really_ like it here at home on my
> _more expensive_ INTeL modem! :)

Sorry, but the normal ST's can do only 19200Bps at maximum. HSMODEM doesn't
change this fact, it replaces only some faulty serial routines and speeds
up some interrupt handling things, that you will get maximum performance
also with standard 8 MHz ST's.

But there is a small hardware serial speeder called RSVE from the author
of HSMODEM (and compatible from others, too). It maps three of the never
used slow rates 110Bps, 134Bps and 150Bps to the faster ones 38400,
57600 and 115200. For the case that you've installed RSVE, HSMODEM
can install a cookie called RSVE.
Other programs can recognise the speedup hardware then and offer
the new Bps-rates directly in menues like CoNnect does.

Nevertheless, the slow 8 MHz ST's can handle rates only up to 38400Bps with
RSVE and HSMODEM, but with accelerator cards you can go up to 115200Bps.
I use 57600Bps, because my modem can't do it faster.

Greetings,
Stefan

Hi,

Several years ago I programmed the Atari 800 XL.
For this computer it was possible to disable screendisplay alltogether (I don't remember which POKE that was), increasing computing speed with about 20%.

Is there a similar mechanism in the Atari ST?
I'm really interested in this, since my Atari is spending most of his time computing.

Thx,

Richard.

It is a small box (size of a genderchanger) you put between your F030 and the
monitor in order to get higher resolutions and higher refreshrates.

2963. Mint type problems....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-01 13:40:19 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2si343$q03@clss3.bangor.ac.uk>
Source record: 32327

Hello everyone,
I'm having a few problems with my mint setup!!
I hope a few people out there will be able to help me....

For starters gzip does not want to work. I have the xfs version of
it on my minix partition in /usr/bin but none of my shells want to
run it, i.e. when I type 'gzip' they say 'file not found'. All the
other files in /usr/bin work fine ! I have checked its permissions etc.,
and tried renaming it with no effect. If I explicitly run it, i.e.
/usr/bin/gzip.ttp then I get an 'out of memory' error. All I'm running
is Mint and Ash on a 1Meg STe - is this normal ??

next problem is that I extracted, using zoo, a couple of readme files
which for some strange reason have the entry type character of the
file mode set as '?'. ie:
?wrxwrxrwx 0 something readme
this seems to have made then unremovable. How can I get rid of them ??
I've tried overwriting them but access is denied; rm and mv fail too...

lastly.... I unpacked mgr yesterday (in fact VDImgr) which seems to allow
me one window with a shell in; if I try to open another window i get a
'cannot get pty'
error... anyone know why ?
is it worth persuing with mgr or should I stick with toswin ?
what's mw2 like to work with ? or miwm ??
All I want is to be able to run a few tos style programs at once in
different windows with the minimum memory usage -
I am getting a memory upgrade soon to 2Meg (or 2.5 Meg) but want
to use gcc (and if possible tcsh) so memory usage will probably be
quite tight !

Thanks for any help !

Dylan

I imagine that the official version of 1.11 will load the gem.sys AES.
If you want MiNT without the MultiTOS AES, you may need to compile your
own version. I'm not sure if it will be possible to distribute several
binaries of 1.11. Probably not - from Atari's point of view, isn't the
main reason to update existing MultiTOS users?

Apparently, there exists a 4.1 version of the MultiTOS AES (as opposed to the 4.0 version shipping). This has been given to (selected?) developers and is faster than the 4.0 version. It may have some other bugs. As far as I know, development of the AES has been put on hold. Anyone out there care to write a freely distributable version of the AES? :)

This problem has been around for a long time. If it hasn't been fixed,
you can work around it by using %i instead of %x. This will properly
handle the leading 0x.

HELP PLEASE !

It's happened again. After getting gcc.ttp froma number of people (thanks all!) I have found that my pre-processor is corrupt. I didn't realize this since gcc.ttp wasn't working, and now that gcc.ttp works the gcc.cpp is broken!

I have tested everything else by hand to make sure it is OK, and gcc-cpp should be the last of it (I just know that 2.6.0 will be out before I get 2.5.8 complete, but that's too bad, 2.5.8 is gonna be the last for a VERY long time for me - I'm sick of email servers). Not wanting to ask the people of the net for yet another special favor, I got the whole thing by email all over again. Well, a directory entry in the archive is invalid - and gcc-cpp was not extractable.

AAaaRRrrrrGGGGGGgggggHHHHhhhhhhhhh ....

Anyway, I would really aprreciate it if someone could email me gcc-cpp.ttp from the Gnustuff/Tos/Gcc/gcc258b.zoo archive (2.5.8 non-030 version). In fact, I would be ETERNALLY grateful, or at least until I get something newer than 2.5.8 - which I can tell you will likely be longer than an eternity!!

I have an Atari XE Gs. I also have some tape drives, used on similiar machines. Can anyone tell me the pinouts for a cable to interface these? If possible, I need the port diagram. I am also planning to connect the Atari to a Unix Network I run in my own home. I could really do with the Schematics for an Atari Perpherials <sp?> port.

base64 is similar to uuencode but it follows the MIME standard.
uuencode has some disadvantages, which base64 has not.

> I think it was to do with the system that runs on a Mac..??

It has nothing to do with an OS or machine type, MIME is a system-wide
standard. All you need is the ATARI port of munpack or a mailreader on
a UNIX box that is able to handle MIME messages (elm, pine).

It should be available on atari.archive and as I remember it was
posted to comp.binaries.atari.st a few weeks ago.

Bye,
Knarf

2974. Falcon problem running Genie Aladdin

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-01 20:52:59 UTC
From: patmc@ch.apollo.hp.com
Message-ID: <CqqKoB.8tw@apollo.hp.com>
Source record: 32334

When I upgraded from an STE to a Falcon, the Genie Aladdin program stopped working. When in terminal mode, if you issue a modem command, there is no response from the modem, and in fact nothing goes out over the serial line (modem LED indicators doesn't blink). The Gulam built-in terminal emulator and Flash can talk to the modem without any problems.

I have tried configuring the serial port flow control to both "None" and "RTS/CTS" with no success. The handshake signals coming back from the modem are all fine. There is a port selector on the control panel which says "Serial 1", which is greyed out. Does this just mean that there are no other serial lines to select, or does it mean that Serial 1 is also not working?

I have tried this with and without fpatch2 (the Bconmap fix).

It just looks as if Aladdin isn't talking to the serial port at all, except that after booting the serial port config is set to some default, and after running Aladdin the serial port config is set to what I have selected in Aladdin.

Thanks for any help,
Pat McElhatton

2975. Re: Falcon Newby problems with zoo 2.1, floppy formatters, audio out

Newsgroup: comp.sys.atari.st.tech

Thanks to Rainer Riedl for suggesting the FalconSX accessory - this is definitely worth having! Here is how the 3 problems in my original post got (sort of) resolved.

>1. Zoo problems
> Zoo v2.1 crashes with 2 bombs whenever I try to extract or list the

With the Falconsx desk acc, if you select "STE bus" under the CPU menu this problem no longer occurs. I assume it is caused by Zoo v2.1 doing a longword access on a non-longword aligned boundary.

>2. Floppy drive formatters
> format71.acc, a formatter that allows writing up to 82 tracks and up
> to 11 sectors per track, fails at the very end of the format when it
> tries to write the boot sector. This error happens with all track

As far as I can tell, the Falcon can read the extended format (900k) disks with no problems, but trying to write to these disks trashes the FATs or the boot track and hangs the Falcon. This is not a big problem - I was using the 900k format for archival purposes, so I'll just write-protect all those disks and do archiving on 1.4meg floppies from now on.

>3. Audio output volume problems

The overly loud volume problem is mostly solved - the volume on the headphone jack jumps to max when the Falcon is booted, but I lowered the volume with the audio CPX, so as soon as CPX's are initialized the volume drops to usable levels. I still haven't hooked up my mixer to the headphone jack, though.

I didn't mean to imply that I thought SMS2 was a port of the QDOS OS. I
meant 'implementation' in the sense that SMS2 implemented QDOS functions
thus allowing some QDOS programs to run. In the same way that DR DOS
implements MS DOS functions - but isn't actually a port.

Hi!

I have a problem with my build in ATonce-386SX in my old Mega ST4:

Since I bought NovellDos 7, I cannot use my Harddisk (Quantum, 105MB).
Earlier DOS-Versions for PCs have no problems, but since MSDOS 5, I think,
the DOS would like to format it's drive C with more than 2 sectors/cluster.

What can I do to use a 32MB - Partition under Novell DOS 7?

Almost directly. A host adaptor board is needed. See below.

> Are there PD drivers available for ST/SCSI drives ?

The host adaptor will come with all the software you need.

Ok, here it is. This document is quite old, and parts of it are a bit long
in the tooth. However, it is still mostly relevant. I find particular humor
in my amazement of my buddie's drive capacity (what with me owning almost
a gigabyte of Syquest cartridges alone, fer chrissake). However, at the
time that was a very large amount of space to have on a home machine.
Ah well . . .

In article <bg258s1421.03a3@sycom.mi.org>, bg258s1421@sycom.mi.org (Burley Good) writes:
>I am looking for an inexpensive HD a starters HD. I am looking for a used
>maybe 20m or more CHEAP!!!

You might want to try rolling your own. It is very easy for the ST. You
need:

A host adaptor
A power supply
An enclosure
A SCSI drive

I recommend the ICD Host adaptor. It has (IMHO) the best software, which is
updated frequently (and available free). They also provide an easy way
to add a battery backed up clock to your ST (if you don't have one already,
they can be bought with or without the clock). I also like ICD's because they
report any "sense codes" the drive communicates to the user. I have only
seen one ("read error with recover", induced by dropping something heavy on
the desk while the hard disk was reading), but I find it reassuring that
any weirdness at the device level is reported directly to me (it pops up in
the corner of the screen, by the way). Price is about $80 at last look.
Without the clock, you save $10. Order the SCSI connector cable wherever
you get the host adaptor, and make sure to ask for a dual drive one with a
red wire denoting pin one (to make the installation easier).

Power supplies are cheap. Just pick up an old XT power supply for ~$30 from computer shopper. If you can find a junked PC, you can get one for free.

Enclosures can also be cheap. You can buy one of those huge old style XT cases for about $30 from computer shopper. This will hold all the hard drives you will ever want! Buy a tower stand for $5 and stick it on the floor. You can also go all out
and buy an enclosure which will fit under your monitor (mine houses 2 5.25" devices, has a front mounted lit power switch, mates perfectly with the ICD board, etc) with power supply for about $125. There are several places that sell these for the ST, two being Toad Computers and D&P Computer Supply. Email if you want their 1-800 numbers. Again, a junked PC is the absolute cheapest way to do this. If you can get ahold of granny's old IBM XT, you are in fat city. A nice side bonus is that the old PC motherboards make great wall hangings (big fat traces, lots of chunky looking components). Old PC's are really easy to find, now that everyone is going to 80x86 machines.

Now, the SCSI drive. These can be bought from computer shopper. All you need is a bare SCSI device, no other boards or anything. The ICD host will work with just about anything, but there is a very large list of already tested drives that comes with the host adaptor (which I could probably email to you also). Drives are very cheap nowadays, and if you want to really save money you can get a refurb. Several of the refurb places will guarantee their drives for X number of years (X varies with the particular company), so they can really be the way to go.

Anyway, you will now have your hard disk. You bolt down the drive and host adaptor (you can drill some extra holes in the case, or use wire-ties or whatever), connect the two, plug in the power cords (the ICD comes with a little splitter which connects to a standard PC type power cord), hook up the DMA, and boot up. It is very simple, and is not easily botched up. You only need to pay attention to:

SCSI id jumpers set to some reasonable value
SCSI terminator pack plugged into the drive
SCSI connector from drive to DMA is right side up on both ends
Nothing wiggling around

The first two can be checked via the manual that will accompany the drive (make sure you ask for one, some places assume you already have one), usually a 1 page Xerox. The third can be verified by checking that the red wire side of the ribbon cable is near pin one (which is marked on the board either by a number or by a square solder hole instead of a round one). If the cable is in backwards, the red end will be at the other end of the connection (quite often it is pin 2 that is marked, but you only need to know which end of the connector the numbers start on, and match it with the red wire). These are the only two possibilities. You cannot mess up the power connections or the DMA connection (they won't go in wrong).

The reason you wanted a dual drive cable is so you can easily add another device in the future. You merely have to plug it into the other receptacle on the cable, remove the terminating resistor pack off the middle drive on

the cable (the one on the plug closer to the computer), and check to see that the SCSI id jumpers are set to two different numbers. Oh, by the way, the ICD supports the Syquest SQ555 (the 44mb removable cartridge drive) without any special concerns. Since the Syquest is a SCSI device, you can hook one of these up just a easily as you could a regular fixed disk drive. These only cost about $210 bucks nowadays, with 44mb cartridges going for ~$60.

It really is easy, and there are plenty of computer tinkerers around to look over your shoulder and verify what you do. You can also use a setup consisting of a host adaptor, SCSI controller board, and ordinary PC type hard disks, but you add complexity to the system and lose performance this way. Straight SCSI is much cleaner, and usually much faster (SCSI devices have their controller boards "built in", communicating with the SCSI standard).

If you do get a hard disk, you should immediately buy Neodesk 3 and the Universal Item Selector III. They will make life much nicer. Also, beware of buying too small a hard disk. Megabytes are like potato chips. I have a buddy with a 105mb quantum drive, a 320mb Hitachi, and a Syquest SQ555 with 6 cartridges all hooked to his ST, and he still complains about not having enough disk space! I have not yet gone that apeshit, but I think Mr. Visa might have to talk to Syquest Corp. pretty soon. Oh, notice the my friend above has three SCSI devices hooked to his ICD. This just requires a 3 plug cable.

--end included text--

Some updates to the above document:

Try to find a cable that has a standard SCSI external cable connector on it, in addition to the internal flat connectors for the drives. Toad has these, among others. With this, you can plug more drives into your SCSI bus externally. This is quite handy if you want to plug in a bog-standard Mac external disk into your hard drive chain. It will only cost a few extra bucks, and is well worth it for convenience later.

You can use on of those standard Mac/PC externals on your ST by using an external host adaptor (the Link, by ICD). These are a bit more expensive than internal host adaptors, but they are convenient.

SCSI-2, Wide SCSI, differential SCSI, there are all kinds of SCSI nowadays. I don't think SCSI-2 drives will cause any problems, but I am not sure about the other two. Post a query and check before you buy.

Make sure that the drive you purchase has a jumper to select parity on/off. Some newer drives require a weird SCSI command to do this, which can be a real pain to arrange. The newer Quantum mechanisms are notorious for this. The drive seller should know. Some ST host adaptors can handle parity, some cannot. It is safer to buy one that can be switched at will.

The 3.5" 105mb Syquest cartridge drives are dirt cheap, and very fast. More cartridges only cost $69 each (same price as the 44mb ones)! I just installed one on a friend's ST, and it is really nice (makes my 44mb units look a bit

rustic). Consider one, they are cool.

Ok, hope that helps.

True, a definite prosal stumble. I was thinking more of things like
Universal Item Selector 3, which replaces the standard file selector with
a much more usable one. It does this in a way that is not liked by some
programs (and by Mint/MTOS, I seem to remember hearing). It cannot directly
replace the GEM fileselector because it is in ROM. My contention is that
if GEM were disk loaded, it would be easier to hack on bits and pieces of
the look-and-feel. As it is, it does not appear to be easy to do this
cleanly. Of course, it does load damn fast from ROM (which is a big pro).

As a counter example, look at the Mac. There are inits and system file
hacks galore that effect look-and-feel. I use a nifty one that gives the
windows NeXTstep style buttons/scrollbars/etc. Having all the stuff disk-
based makes this easier (my educated guess).

On the other hand, I'm not a GEM or Mac programmer, so this is just my $0.02.

Also, will they (or perhaps someone already has) release the source
complete (so all I have to do is download and compile)? Normally I'm not this
lazy but I am not very confident with patches, and since I am already having
problems compiling the Mint 1.09 sources, I think I may have let a bug creep
into my compiler setup.

You don't need any switches to enable floating-point support... gcc is
more sensible than most PC compilers.

> b) This is a bug in gcc 2.5.3. If so, is this solved in newer releases?

Yes. gcc 2.5.x (x <= 7) doesn't produce working 68000 code (though it
works fine for 68030).

> c) This is a bug in the mint port of gcc 2.5.3. This can easily be checked by someone running the TOS version of gcc 2.5.3.

gcc for TOS and gcc for MiNT are the same thing, unless you get the
sharable version (mgcc*.zoo).

>
> What's going on ?

Um, how can you tell?

If you do this:

```
char *bozo = (char *)malloc( 1024 );
free( bozo );
bozo[1] = 'x';
```

You won't get an error, and when running under normal TOS, you won't
have any problems. Add MiNT or Mag!x or Geneva, and another program
might've allocated some memory there... crash city.

Besides, the _pointer_ doesn't go away, just the thing it's pointing to.
You pointer variable (ie, *bozo above) will always have something in it
(a memory address).

> :""
>}
>
>So how do I do it!? And how do I pass the variables into registers!?

If the entire routine is going to be in assembly, then why not just write it
into its own .s file? Oh well, no matter, you still need to use gas/MIT syntax.

Aside from a little preprocessing, the asm code is passed straight to gas
anyway. The empty arguments that you have above (following the colons) inform
the compiler what variables will be passed in and what will be returned (written
into by the asm code).

Anyway, while following the above model is rather a bass-ackward way of coding
things, here's how you would do it:

/* Take 3 input integers, add together, return the sum */

int sum(int x, int y, int z) {
register long retvalue __asm__("d0"); /* return value */

asm("
movel %1, d0
addl %2, d0
addl %3, d0"
: "=r"(retvalue) /* outputs - any variables that are written */
: "g"(x), "g"(y), "g"(z) /* inputs */
: "d0" /* clobbered registers */
```

```
);
retvalue;
}
```

Parameters are named with a '%' and a digit from 0 to 9, with the numbers matching the order that the outputs and inputs are listed. The outputs and inputs are listed as a "constraint" and a (variable name). For complete information on constraints you need to read the GCC documentation. A brief list of constraint codes for GCC/68000:

```
= this variable will be written to
r this variable must be in a register
d this variable must be in a data register
a this variable must be in an address register
m this variable must be in memory
g general - variable can be pretty much anywhere
```

The list of clobbered registers tells the compiler which registers your assembly code will use without saving. The compiler then generates code to save and restore these registers around your assembler code, as necessary.

> box. Why does GEM have to stay the same?

GEM is hard to change because it's in ROMs; Windows (and the Mac) is
easy to change, because it gets loaded into memory... all programs have
to call the window display functions the same way.

Under GEM, we have programs that call the window functions properly, we
have things like the Desktop that jump straight into the ROMs (ever
notice how it *always* uses that damn standard fileselector, even when
you've got a real one loaded?), and ones that do other weird things.

It'd be nice though... I'd love to have a NeXT look 'n' feel... ;-)
(Actually, just give me a NeXT...)

>
I have a 245MB harddisk. It was formatted in the factory. I partitioned it using AHDI. I assigned two 31Mb partitions to ATonce. 32Mb is the absolute maximum it can handle. Since partitioning does not give exactly the requested sizes, I did not take any changes and took 31Mb partitions.
Don't forget to click the "C" in the partition setup of ATonce!

I'm using MSDOS 6.2.
I used it's fdisk and formatted the partitions using Norton's formatter.
I didn't experience any problems with that.

By the way, I was unable to make HDT.SYS cooperate with DOUBLESPACE.

Hope this helps.

You need Load Aladdin to run ALADDIN ST on the Falcon030. You
can download a demo of Load Aladdin from the ST Aladdin RT
Library (page 1000) on GEnie or leave GEmail to K.GERDES on
GEnie to Xmodem Mail you the full version (it's a $15
shareware program). Load Aladdin will also allow ALL Atari
users to do things like use STalker and Aladdin at the same
time (e.g. letting STalker do a background file transfer while
reading/writing messages offline on Aladdin).

>Is that a version that will load the gem.sys AES?

Any version of MiNT (> 1.0, I guess) will load gem.sys if you set it to in
the mint.cnf file. There's nothing special there, the MiNT kernel is pretty
much the same whether or not you package "MultiTOS" or really Multi-AES
around it.

(re: another article in this thread - I never had much luck running 1.09
either, my sources got corrupted somehow. 1.10 made a huge difference, as
far as stability goes. 1.11 will be even better yet.)

Hmm, where's the FAQ? MiNT (which was "MiNT is Not TOS" and now is "MiNT is Now TOS) is a multitasking *extension* to TOS. It allows, among others things, process handling (a la unix), ability to run up to 1 GEM program and multiple TOS/TTP programs at the same time, can load in different extended filesystem (XFS) drivers (for such things as minix/unix-type partitions, ramdisks, etc), etc. Loaded in, it really won't do anything for you unless you want it to (by using MiNT-specific software, tho your normal stuff shouldn't be affected). MiNT is also the kernel for Atari's MultiTOS (but MiNT != MultiTOS)...

>2. Is there a version Eunochs/Unicks...erm...that operating system for
>the ST

There was a version (dunno if it ever was released) of SVR4 Unix, but other than that, I don't think so. HOWEVER, with MiNT, a decent shell (such as TCShell), the GNU C/C++ and misc utilities, and various other software (available on many FTP sites) you can have what is essentially a unix clone (I dunno how familiar you are with unix, but all unixes are not the same anyways, so generally it takes compiling source code on your own type of box to create a usable binary - trading compiled versions of unix stuff is not very reliable with different systems). And with MiNT-Net being developed (a Berkeley-like TCP/IP etc type of networking system) there will be various FTP/FSP and other type similar networking utilities. I guess the answer is "sorta" or "almost" ;-)

>5. Does anybody do an interface that allows you use a MicroSoft type
>mouse, especially the ones with mini-din conx.

I believe I've seen some software to let you use a Microsoft-type mouse *through one of the serial ports* (a pain if your ST only has 1 serial port and you have a modem, but not bad if you have a MegaSTe/TT/Falcon). Check the usual FTP sites (atari.archive.umich.edu, etc) for this software (get the 0index or INDEX and look for "mouse" and "serial")...

>6. Why is the Sky blue....erm Raleigh Scattering?

Something to do with the light refraction through the atmosphere (I guess :-)

Hope this helps ...

2994. TCSH curser weirdness

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-02 14:15:16 UTC
From: selick@acs4.bu.edu
Message-ID: <2skphk$c0l@news.bu.edu>
Source record: 32361

I've been using tcsh on a unix machine for a while, so I'm familiar with its normal functionality. It seems however that on my 1040STe with mint 1.08, and the st52 termcap in /etc/termcap, the curser doesn't appear unless I run micro emacs, and then everything runs just fine, even after exiting emacs. Also, in the st52.ttp terminal program, I can't get the curser keys to work at all. I think these are separate problems.

Thanks,
Steve

2995. MiNT multitos compilation flag.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-02 16:39:10 UTC
From: wilknsnk@teaching.physics.ox.ac.uk
Message-ID: <1994Jun2.164831.2956@inca.comlab.ox.ac.uk>
Source record: 32366

Articles in this newsgroup have mentioned the multitos flag (used when compiling mint) several times, including the articles on the release of mint 1.11 binaries.
What does it actually do?
I've got MultiTOS with mint v1.04 but the mint binary (presumably compiled with the multitos flag set) works fine with or without the multitos AES. Depending on MINT.INI contents I can boot into MultiTOS, tcsh or mintshell (low memory usage!).
The only thing I can think of is booting the non-multitasking AES with mint present, but that seems fairly useless to me anyway.

Karl Wilkinson.

I believe the instructions for that 38400 mod are on atari.archive in
Utilities/Tosfixes/38400.lzh. There are several such mods out there, and
they have different capabilities (and difficulties of installation).

3003. 1040ST Floppy Swappy (Sorry...)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-03 02:35:13 UTC
From: lordthan@news.delphi.com
Message-ID: <2sm4t1$l76@news.delphi.com>
Source record: 32369

(Sorry, couldn't resist the light humor...) :)

Anyway...

I recently hacked my 1040ST's case to install a new floppy drive in it. The drive I bought appears to be a PC-type drive; this makes sense, considering the number of times I've seen this type of replacement scheme mentioned.

However, I got to thinking. In the PC world, there are dual 3.5" floppy drives that fit in a single half-height 3.5" drive casing. So, when the drive is installed in your PC, you get two 3.5" drives in a single bay.

Can this swap be successfully done to a 1040ST? There's a computer flea market near my house in a week or so and I'm sure I could get the drive at a good price. If I can get two internal floppies in my 1040ST, life would be good -- especially considering they'd be two DS/DD (or even DS/HD) drives.

Replies to mail would be appreciated.

Is it possible to re-arrange the wires and change the connector and use it as a standard Atari mouse, instead of using special driver software for it?
Maybe even get 3 mouse buttons to use with UNIX?

Hallvard, Oslo, Norway

3005. Internal sounder circuit wanted- Piezo ceramic

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-03 03:48:24 UTC
From: hallvart@ifi.uio.no
Message-ID: <2sm968$fpm@solva.ifi.uio.no>
Source record: 32371

I'm thinking about installing a piezo ceramic element inside my STE to provide sound (my Multisync II monitor doesn't have a built in speaker). There's not enough space inside my STE to accomodate a speaker 8even a very small one), as I'm going to install an internal 2.5" IDE hard disk inside the machine, so a piezo ceramic element woul be ideal. i know the sound quality wouldn't be the greatest, but all I need it for is the beeps, pings etc...

Does anyone have a driver circuit for a piezo ceramic element that can be adapted for the audio out of the machine (there is a pin in the 13 pin DIN video out connector for this).
Thanks.

Hallvard, Oslo, Norway

3006. Falcon memory configs. What's possible.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-03 03:54:44 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <2sm9i4$njl@news.dmpe.CSIRO.AU>
Source record: 32378

Hmm. Now I know the Falcon requires even banks of ram, and acheives the following configs.
1 meg by 4*256k simms.
4 meg by 4*1meg simms.
14 meg by 4*4meg simms.
(it normally doesn't use simms, but bear with me.)

Now on my STe I can have 512k, 1 meg, 2 meg, etc.
Is it possible to have a bank with 1meg and 256k and 1 meg and 256k to give 2.5 megs of memory!?

What about it!? Is it possible!? I know 8 meg doesn't work (yet), as the two banks would have either a 4 meg simm in them each, or 4*1meg simms, which would not fit in ....

But would 10 meg (2 * (1 meg, 4 meg simms)) be possible!?

No doubt I am off on a tangent, but I don't see why the 'enhanced' mmu of the Falcon should eliminate what was working in the STe ...

Karl.

Yes... The purpose of DRDOS is to mimic MSDOS as close as possible,
however, and presumably add some extra bits. Whereas SMS2 is (or so
we're told) supposed to be able, in time, to do quite a bit more than
QDOS.

(Compare SMS2 with SMSQ, which is a re-implementation of QDOS from
scratch which is supposed to be as close to QDOS as possible.)

I suspect that you could create an MFDB that describes this larger area and
then draw to it, but I'm not sure how you would convince VDI to use the new
MFDB. If you have any success, let me know.

Er, no, I haven't noticed... The MTOS Desktop calls Selectric very
nicely, thank you very much (eg for the Read .INF file option and Save
Desktop option).

As regards patching the AES, well, why couldn't WINX be extended to
change the look and feel of the window resource tree? Better still,
just leave hooks for other people to write new looks and feels (the
plural of 'look and feel', anyway :-)

In a message of 01 Aug 93 12:18:16, Daniel Hastings wrote:

DH> This is to give a Falcon a drive B port? Can you give us the details
DH> please?

Sure, it's idiotically simple. Decide where you want the cable to come out
of your case (I recommend the cartridge port, since it's already the right
shape). Get a ribbon cable of the proper length to connect to the drive
you want to add, plus the width of the Falcon and perhaps another 3 inches
for luck. Digikey sells a 34-pin male IDC crimp-on header (rather
expensive, IMHO, but hey, it'll do the job!) and you put that on the end of
the cable; then add a female header right next to it, and another at the
far end. Unplug your internal floppy, plug the new cable into the short on
in the Falcon, plug the next female connector into your internal, route the
cable, and plug the far end into your B: drive (change the jumper on that
one to make it drive 2 (or 1 if the numbering scheme starts with 0). Test
that it works, and put the case back on your bird.

It's not elegant, but it is simple.

-!- FIDOdoor+ 3.2.7 [IOSmail 0.89]
! Origin: State your business and leave! (51:2/10.0)

Or you can plug a scsi floppy into the scsi-ii port...

>Is it possible to have a bank with 1meg and 256k and 1 meg and 256k to give 2.5
>megs of memory!?

No, it won't work. Think of it this way... The reason it works on
the ST/STE is because it has 2 banks of 16-bit RAM -- the Falcon030
essentially has 1 bank of 32-bit RAM so ALL RAM chips in the Falcon030
HAVE to be the same size. The reason 8MB is a sort-of possibility is
because there ARE 2 megabit RAM chips out there -- just not many when
compared to 1 megabit and 4 megabit ones. Using the FalconWING SIMM
expansion, the Falcon030 can use a single 32-bit SIMM (one of those
72-pin jobbies!) instead of 4 8-bit SIMMs (like the other Falcon SIMM
expansion board(s).

> [Further Description deleted...]

If it would be that simple! Unfortunately, Atari didn t only "forget" to
build the port, but they also "forgot" to connect the DriveSelect1 signal!
So, if you build that cable and connect it to your second floppy, as
described in the original message, it won t work though! But there is a
way to generate a DriveSelect1 signal, thus "cheating" the OS. It was a
little hardware-hack described in the ST-Computer (a german ST magazin)
early this year, don t remember the exact issue now. I have build that
little "interface" by myself, but have had no time to test it so far. If
it works, I could post how to do it, if there is any interest. Also, I
could look up from which month the ST-Computer was (I think it was 2/94).

Greetings, Thomas

3017. Monitor Questions

I have been offered a monitor (the specs are below). My problem is will
it allow me to display True Colour and/or 640/400 Hi-res mono on my
Falcon?

A little more on the monitor:(mostly from the tech. manual)

Type Mitsubishi 13V" high-resolution colour display monitor
Model C-3419/3419C
A.C voltage 240 or 110(tap changeable)
A.C. freq. 50 - 400 Hz
Power consumption 180VA
Termination 75ohm or high impedance (switch selection)
Connectors BNC all inputs
Sync-Composite sync of TTL level and negative going (active low)
Input levels 0.7 - 1.5Vp-p for R,G,B
1.0 - 5.0Vp-p for Sync
Scanning freq.
Vert freq. 40 - 70 Hz
Hor. freq. 15.5 - 24Khz (tap interchangeable) ** runs happily at **
** 27KHz...Dave **

Thanx inadvance.

No, not with a serial mouse (most common on PCs nowadays). You can do it with a PC bus mouse, including the Microsoft version. Serial mice communicate with the machine in a totally different way than do bus mice (Atari and Amiga mice are such). You can take an Amiga mouse and switch a couple of wires to make it work on the ST. My understanding is that the wires have little plugs on them, so no cutting or soldering is required. There are also plenty of nifty ST mice available.

Ok, so far so good.
But now, can you explain: Which is the technical way to decode BASE64?

I think, there may be a sort of algorithm to convert this text-bytes
back to binary. Text only uses 6 Bits of a byte, maybe I only have to
reconvert it in taking the first 6 Bits and refill it up to 8, then
the next 6 Bits and so on...?

Do you know it?

Hi,

I have a Mega4 (towercase, SM194 19" screen) and a Falcon.
I keep the Mega around for black&white graphic work but -
it obviously requires a standard Atari monitor for boot-up,
while I don't need it myself and I could use the extra space on my desk.
Is there a way to fool the mega into thinking there's a monitor
connected while there's none?

thanx,

Paul

Are you trying to work out free space as your end result? If so, simply use the DFREE command. If you really do need to know the total size, use the dfree() [GEMDOS 54] call. That will give you a pointer to four unsigned LONGs; number of free clusters, total number of clusters, bytes per sector and sectors per cluster. Multiply the last three figures together and you've got the total size in bytes.

I have the FalconWING expansion in my machine, but it does
not accept 72-pin SIMMS; it takes up to four 30-pin SIMMS.
Perhaps there is another variant of 'FalconWing' which can accept
a 72-pin SIMM, but my understanding is that there is only one
device available which can accept one 72-pin SIMM and I believe
it is made by a company called Marpet Developments.
I have 4MB 72-pin SIMMS I would like to use in my machine but
have been unsuccessfull in scourcing an adapter which will accept
four of these. My understanding is that the physical space required
inside the machine to accomodate four 72-pin SIMMS is not available,
but I would be very interested in hearing if such an adapter is
actually available?

Look on the bright side: it's also less susceptible to virus contamination
as compared to MS-DOS and System/Finder.

Would some kind soul post or email me the format for Protracker sound modules,
or point me to an ftp site from which I can ftp it? I'm primarily interested
in where the name of the module and the names of the samples are stored.
Thanks in advance.

Ooops! You're right, I got it mixed up. The Marpet one is the
one that accepts single 32-bit SIMMs. The other ones (FalconWING
and one other one that I know of) use 4 8-bit SIMMs.

Sorry about the mix-up!

Hello Roger,

My address _is_ in my software; all of it. You can find it in the
documentation, or the online help. Since I'm posting anyway, though,
I'll mention both of my addresses here:

ess@tibalt.supernet.ab.ca
mforget@elfhaven.ersys.edmonton.ab.ca

[> I would like to see if he could include MIME in a later
[> version of his 'ESSCD' program...

I have the source code, but have not had time to look at it. The
archive is huge, so I have been putting it off.

[> The source and program of the Atari port of MIME is at tu-berlin,
[> in the archivers directory, I did not see it on A.A...

Now THIS I did not know about; I will get the source code you mention
and see what the copyright status is. If it is still public domain,
I'll try to implement it for ESS-Code. If not, I'll have to work from
the (blech!) Unix source code. If I do incorporate MIME into ESS-Code,
I'll post an announcement here when I am ready to release the new
version.

3035. Serial port speedup h/w mods wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-04 10:14:19 UTC
From: martin@gw6hva.demon.co.uk
Message-ID: <770724859snz@gw6hva.demon.co.uk>
Source record: 32203

Hi ...

I've been floating around various sites looking for the hardware mods for the serial ports on the ST - can I find them, no...

Somebody said they were on a.a.u.e in /pub/atari/utilities/Tosfixes in a file called 38400.lzh - they're not.

I just found the rsve_1.lzh file in the index on a.a.u.e but 15 mins later, it refuses access, pointing me at one of it's mirrors but after careful searching, this isn't on the mirrors (well I ain't found it).

All I want is a h/w details to make full use of HSMODA04, if someone has them, can they please e-mail them to me.

Thanks......

38400.lzh has been moved to the Utilities/Tosfixes directory. Here are
the files contained within:

Tosfixes: 3rd party fixes to atari mess ups

38400bps.lzh 10 Hardware mod improves RS232 throughput
fser096b.lzh 52 Fast serial hack, includes MegaSTE PAL fix information
fix_gdos.lzh 3 Fixes vdi handler error.
foldrxxx.arc 1 Fixes 40 folder problem
hsmoda04.lzh 89 Good serial port fix, ST's to Falcons, German/English
poolfix_cb.arc 6 Claus Brods pool fix
quicktos.lzh 3 Boot older versions of TOS from disk.
rsve_1.lzh 31 Instructions for a small board - very fast serial ports
serptch2.lzh 5 Fixes bug in TOS 2.02/3.01
sos_206.lzh 225 Some prgs to make 2.06 nicer
tos14fx2.lzh 2 A newer version of tos14fx5
tos14fx5.lzh 5 TOS14file with bugs fixed and xbra support. Go figure.
vdifx110.lzh 5 Fixes invalid handle error message with GDOS

This I don't understand. Do you mean you found the file with archie, but
could not get onto a.a.u.e? The site is very busy these days. Try ftping
late at night, or on weekends.

> All I want is a h/w details to make full use of HSMODA04, if someone has

To get the most out of HSMODA04, I guess RSVE would be your best bet. They
were both done by the same person. I would love to have an RSVE board, but
I cannot read German, and I don't know where to buy one.

: a different size (or at least width) for drawing commands. Is this possible
: without major system hacks?

The only clean way is to use the MEMORY.SYS driver that comes with
Speedo-GDOS and Font-GDOS. It can be passed the width and height of the
desired area, but it can only draw in monochrome. I think it's described
in the Speedo documentation somewhere. I'm using this method to build
up the printer bitmaps for papyrus' own printer drivers (thogh papyrus
now also supports normal GDOS drivers), and it works fine.

From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1834@usdtsg.DaytonOH.NCR.COM>
Source record: 32217

Forgive me if this sounds like a simple question, but it's one that has stumped me a little bit. I would like to be booting up my hard drive with the AHDI version 6.061. Now the question: how do I do this since there's only the AHDI.PRG file in the archive? I tried removing my current driver (version 5.x I think) and reinstalling it, but yep 5.x returns.

If there any simple way for me to get my harddisk booting up with this (I assume) latest and greatest version? Just for the notes, I'm on a MSTe/TOS 2.06...

I don't really have a problem with GEM's standard file selector
(except in the old TOS versions), but I use Universal Item
Selector because it's so damn useful (e.g. handles all the
options like Rename, Delete, Move, Copy, Find, Format, Create
Folder, view/print (will view non-LF files fine, plus has hooks
to view pictures), plus even lets you set file attributes) --
it has an .ACC for calling it anytime you want, plus it handles
things a lot more efficiently (i.e. it's faster) than TOS. I
rarely, if ever, use the normal desktop options for these things.

In the HINSTALL folder is a file called shdriver.raw. This is just ahdi.prg
renamed. All you need to do is delete shdriver.raw, copy the new ahdi.prg
into the folder and rename it to shdriver.raw. Now run HINSTALL and install
it on the drive of your choice.

3048. Calamus SL and HP560C color printing

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-05 17:24:18 UTC
From: michaelk@pacifier.rain.com
Message-ID: <CqxpoK.y4@pacifier.rain.com>
Source record: 32225
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have had nothing but frustration trying to gain acceptable color print-out results with documents which contain imported graphics (TIFF,IMG OR GIF) from Calamus SL using my HP 560C (uses 550C drivers) printer. My set-up is: a Falcon with 4 megs ram, VGA monitor in 256 color mode. I know the prints can be ALOT better because I also use Image Copy 2 which provides excellent results - smooth dithering, with screen and print colors virtually the same with very little adjustments.

In Calamas GIF is the only format which will even print an image similar to the screen. I have tried adjusting the Color Seperater Control lines, the Linearity Control lines and the Raster Generator pixel relationships - which all make alterations to the images sometimes , but do not improve the print quality when compared to Image Copy results. The results are always off color with high or low contrast and a grainy image which looks closer to 8-bit then anything else. Also the screen image for an import is never as smoothly dithered in Calamus as it is in Image Copy. When using TIFF or IMG the printing consists of series of dithered bands . I know this only affects import images because when I print a document which contains a colored, pattern frame from the Raster Area Module , that particular frame(s) prints out as it looks on the screen.

Of course my hope is that I am doing something wrong , that Calamus which is considered to be a top-end DTP program, would give me some of the best printed results. Or is that my fear that the Graphic Import Modules and /or HP 550C drivers is one of Calamus SL's weaker areas.....Any help or comments would GREATLY be appreciated.

Rename AHDI.PRG to SYSDRIVER.SYS and copy it to your boot drive
(probably C:). Do NOT run install after this.

Hope this does it. :-)

The header says it all, really.
There are lots of programs around which can be run as desk accessories,
or renamed to .PRG's and run from the desktop. How is this done?
I presume that to run an acc as a program I just have to remove the call
to menu_register(), open the window immediately instead of waiting for an
AC_OPEN message, and quit the program when the window is closed instead
of returning to the message loop. The thing is, how do I find out whether
I am being run as a program or an accessory?

You have to install the driver using the HINSTALL program. If you don't have
it and an older version of AHDI is already installed simply copy the newer
version of AHDI onto drive C and rename it to SHDRIVER.SYS. This is
basically the same HINSTALL would do, i.e. copying AHDI.PRG onto drive C
with the new name SHDRIVER.SYS.

I would say it's too limited *for my use*. As a basic file selector, it does what it's supposed to do (give a list of files to select from and a way to get to a different drive's worth of files), but I have found that some features of say UIS III or the built-in Geneva file selector (in particular, the "file manipulation" functions) are more than simply useful to me, they are necessary.

Here's a quick example: say I want to download files to my ramdisk (which is drive J:), mainly so there is negligible delay in writing to disk so my transfers gain a little overall speed (well, take a little less time). Well, my J: drive is only 1 meg, so when I hit that, I need to copy stuff over to my hard drive. It is nice just popping up the file selector, and moving everything over, and then continuing on with my transfers, without having to unload my current program, run some sort of copy program, and then load back my terminal program again (which is a hassle, and wastes more time)...

For me, the copy and move functions are the most important (and used on a daily basis), followed slightly by the rename and delete)...

Of course, these are not necessary to "select a file" but then necessary and convenient are two different subjects :-)

Thanks for the reply. I did get a reply for a slightly quicker
method, which was simply to replace the shdriver.sys file on my
boot drive with a renamed ahdi.prg (renamed to shdriver.sys) directly.
Saves the step of using HINSTALL again, but I probably will stick a copy
in my HINSTALL directory in case I need to reformat or partition my
harddisk in the future...

>AC_OPEN message, and quit the program when the window is closed instead
>of returning to the message loop. The thing is, how do I find out whether
>I am being run as a program or an accessory?

You're right about the method being followed. The way to distinguish between
prg and acc is probably compiler dependent. Pure C's startup code initialises
a variable '_app' that's set to 1 if we're a prg, and to 0 if we're an acc. So
the resulting program framework looks something like:

```
int main( void )
{
extern int _app;

/* appl_int, initialise work_in, call v_opnvwk, etc */
if (!_app)
menu_id = menu_register(appl_id, " acc name");
else
graf_mouse(0, NULL);
/* load resource, etc */
if (!_app)
event_loop(menu_id);
else
gem_prg();
/* rsrc_free, v_clsvwk, appl_exit */
return 0;
}

void event_loop( int menu_id )
{ /* for ACC only */
int event, message[8], dummy;

while (1) {
event = event_multi( /* lots of parameters */ );
if (event & MU_MESAG) {
wind_update(BEG_MCTRL);
if (message[0] == AC_OPEN && message[4] == menu_id)
gem_prg();
wind_update(END_MCTRL);
}
```

```
}
}

void gem_prg( void )
{ /* the real stuff */
form_alert(1, "[1][ |Just a test][ OK ]");
}
```

Of course it all depends on the availability of a variable like '_app' -- I don't know your compiler (and don't even know which language you're using :-) so there's rather little I can say about that. Check your manual...

With Selectric, selecting a file is faster: you can type the first characters of the file name and return; you can define default paths and extensions. You can select a drive by alt+letter. With the standard file selector, you can't directly select the drive Z for instance. Moreover, Selectric can display more files (so I never use the scroll bar).

I don't use the other features for now, but they could be very useful if one day I need them.

From: petep@info.isbiel.ch
Message-ID: <2surhq$3g8@vega.info.isbiel.ch>
Source record: 32236

i use the resource counstruction set distributed from atari (version 2.9)
for my own applications.

i changed now the name of a menu-entry and saved the new rsc file. cause the new
.h-file i recompiled my programm (with PureC) and started it. my application begins
to draw the menu, but suddenly it stops and the only thing i can do is rebooting.
i think it must be an error produced by the resource construction set. any idea
how i can fix this, or do i have to rewrite the hole .rsc?

3062. Installation of finger/fingerd

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-06 10:08:02 UTC
From: tj@aiscube.AIS-dortmund.de
Message-ID: <2susi2$gm7@aiscube.AIS-Dortmund.DE>
Source record: 32238
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello Netter's

After i received a lot of mails on how to install the finger-tools, here
are the most important points to watch out for:

- do not try to start the fingerd in rc.net! it has to be started by
inetd. Look into "etc/inetd.conf" and read the MiNT-Net Documents.

- If your "finger" is not in /usr/bin, make a copy or a link, so that
/usr/bin/finger is existent. Otherwise your machine will not send out
any infos (fingerd calls "/usr/bin/finger")

- and PLEASE, PLEASE, don't send me more mails on what finger is, and
what it does, and how to use it ....

Believe me, threre are a lot of books, which describe daemons, tools
and basics of Internetworking.

3063. detecting use of alternative RAM!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-06 10:32:09 UTC
From: cs93dlh@dcs.exeter.ac.uk
Message-ID: <1994Jun6.103209.7664@cen.ex.ac.uk>
Source record: 32239

Is there any way to determine if a malloc'ed block of memory is in ST RAM
or TT-Alternative RAM? As DMA sound doesn't work from TT-RAM I need my
program to behave differently depending on where the buffers are.

Also is there any way to force malloc to get ST-RAM even if the 'malloc from
TT RAM' bit is set in the program header?

Answers on how to do this in TOS 4.0x would be infinitely preferred to new
calls in MultiTOS etc.
Thanx,

It depends on what compiler/language you are using. In Lattice there is a
different starup stub which you link with that has a couple of variables
which you can test to see if you are running as a PRg or ACC. .

Check your documentation...

Source record: 32094
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have had a look at the High Speed option called RSVE..

What you are going to need is a GAL 16V8 and HC4040
and a Crystal Oscillator 1.8432 megs...

Note: not just a Xtal but a full Crystal Oscillator...

The main problem is to program the GAL...???

What this does is to replace the MFP 110,134, and 150 bps clocks,
with new faster clocks...

The thing is completely automatic, the GAL detects these speeds comming
from Timer 'D' and replaces them with the new faster clocks to the MFP...

So. 150 = 115200
134 = 57600
110 = 38400

There is also a Led to show when he new speeds are active, also
there is a small program to set up a Cookie, so that other programs
know that 110 bps does no = 110 bps but 38400, one such program
is Connect...

There is a mention to TOS 1.6, but I think that is to do with the
Cookie, if I remember correctly, the real Cookie was not implemented
till TOS 1.6, but I stand corrected on that one...

I hope this is of help, if not please e-mail me or post here...

I can only help you if you're using Pure C. There is a global int called
_app, which is set to 0 if you're run as an .ACC, else it is 1.

3069. Updating GEM programming skills

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-06 15:21:01 UTC
From: fountad@vax.sbu.ac.uk
Message-ID: <1994Jun6.152101.6687@vax.sbu.ac.uk>
Source record: 32097

Ive recently rediscovered my old ST after a few years away from it. Id like to get back into programming, but things have changed a bit since I last used a compiler or assembler for GEM.
First up, is it still practical to develop on an ST with TOS 1.02? Im hearing about cookies and other things I dont know anything about - does my OS support these, or are they higher level things which are supported by the application?
How do I develop these smart new GEM interfaces Im seeing these days? I assume that pop up menus, moveable dialogs etc must come from libraries, as I get them on TOS 1.02. Are such libraries in English in the PD?

Thanks, Del

I have just bought a Falcon (TOS 4.01), the only problem is that it crashes
all the time. here is just a short list:

The mouse pointer disappears.
The system hangs.
When running MARCEL (and occasionally something else)
an error such as 'Fatal Error... Must reset machine'
appears.
I get all allerts about memory violations every time.

I am using MTOS (MiNT) 1.10 (beta version), plus the following programs in the auto folder:
Selectric
GEMRAM
WINX
FS
JPEGD
FPATCH2
MACCEL (mouse accelerator)
AHDI

Can anyone help? Its driving me up the wall!!

Hallo Stefan,

Vielen Dank fï¿½r Deine Mail und das ï¿½bersetzen.
Es hat leider etwas lï¿½nger gedauert Dir zu antworten.
Bei der Installation des 'DVI 2.1' habe ich noch ein biï¿½chen probiert
und auf einmal ging es.
Durch weglassen des " \ " hinter dem Fontpfad und setzen der Toleranz
fï¿½r die Zeichensatzauswahl auf 100 %. (Promille) = 10% funktionierte
es dann.
Diese Kombination hatte ich wohl noch nicht versucht.

Du hast von einer neueren Version 'DVI 2.61' geschrieben,
wo kann ich diese bekommen?

Im Moment habe ich noch das Problem, daï¿½ wenn ich von der TEX- Shell
drucken will zwar die Richtigen Parameter wie Rï¿½nder ect. als
Parameterdatei
von `DVI` geladen werden, jedoch diese beim Druck und im Preview nicht
erscheinen.
Wenn ich nach dem automatischen ï¿½ffnen einer DVI Datei (durch drucken aus
der Tex Shell) diese sofort schlieï¿½e und durch erneutes manuelles ï¿½ffnen
wieder erscheinen lasse sind alle Rï¿½nder und Einstellungen in Funktion.
Vielleicht klappt es ja mit der neueren Version.

Tschues
Jï¿½rg

We've never had any problems with Calamus SL outputting color graphics (except once when printing to an HP Deskjet 500c with the wrong settings in the printer driver). Contact pdirect@delphi.com and ask him about it. He can help you with your problem.

: Thanks.

Same way you would from any other kind of program. Which chip are you trying
to get this information from? MFP (ST/e) or SCC (TT/Falcon)?

Yes, gemdos in TOS 2/3/4 has a call for this. Mxalloc(blocksize,mode)
Modes are:
0-ST RAM
1-TT RAM
2-ST RAM if available otherwise TT RAM
3-TT RAM if avaialble otherwise ST RAM

> I am being run as a program or an accessory?

As far as I can remember, (all my docs are at home) the method is compiler-dependent. I think some GEM libraries use the return value of appl_init(), but I'm not sure how. One of the 4 or so startup libraries I have for Heat-and-Serve C seems to check the stack pointer: if the value is meaningful, it is the previous program's stack (?) and it used a Pexec(0, ...) call, otherwise if it is NULL, the program has been run as an accessory.

This is all from memory, but I can mail you the startup code if you are interested. I assume it works just as well with MultiTOS.

> NOW what do I do?

Just set the speed to 19200, your modem will convert it automatically, when
using compression it will benefit from the higher speed as more bytes are
needed from the computer than 14400 bits per second....

3079. Help needed with drive...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-07 00:53:11 UTC
From: twymer@cie-2.uoregon.edu
Message-ID: <2t0gdn$loa@pith.uoregon.edu>
Source record: 32101

Hello. I'm posting this message for a friend who's having trouble posting from his usual system.

A couple years back I was given a Future Systems Inc. GTS-100 disk drive without connector cables or power supply. It has been sitting around ever since, but now it turns out that I need it. I assume the cables I have now will suffice to hook the drive to my Atari, but I have no idea what kind of power supply it needs. The drive itself just has an identifying sticker and an FCC compliance sticker on the bottom, but no information about the drive itself.

Could anyone out there with documentation on this type of drive please tell me what kind of power supply I need to find for it? I have several sitting around here but I'm not about to just plug them in and see if they work. What I need to know is the voltage, amperage, and the polarity of the plug that goes in back.

Also, I read a message earlier about someone selling one of these drives, and he wrote that it was a double-sided/SINGLE-density drive. Would this be true, or was it just a typo? All my disks are double-sided/double-density and if this drive can't handle that, I don't want to waste any time or money on it. The person who gave this to me said it was DS/DD, I think, but that was a long time ago...

I just bought an upgraded 520 to replace my 1040, which died a couple months ago, but the drives with the 520 are both single-sided, so the computer is essentially unusable right now, even though I've verified that it's working just fine. So any information I can get would be much appreciated. Either posting or e-mail is fine.

Thanks for listening, and I hope someone can help...

3084. SCSI Host adapter

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-07 10:20:17 UTC
From: huveneer@math.ruu.nl
Message-ID: <1994Jun7.102017.7789@cc.ruu.nl>
Source record: 32107

Hi,

I would like to know which SCSI host adapter is built in my Atari Mega STE 4.
You'll probably think, why does he want to know that?
Well, I also have an 386 emulator built in, and I would like to try out
wether I can run Linux on it or not. Linux needs to know what type of
host adapter I have.

I assume there is some common host adapter built in all Mega STE's.
I don't know if it is important, but I have a 245 Mb Maxtor harddisk.

Also, Linux requires that the SCSI adapter uses interrupts.
Is this enabled by default in my Mega STE?
(I sure hope my 386 emulator supports all this kind of stuff.)

Any help is welcome here,

thanks,

Richard.

3085. gzip problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-07 11:23:58 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2t1lce$6r4@clss3.bangor.ac.uk>
Source record: 32109

hello,

Has anyone experienced problems with gzip ? I'm using a 1Meg STe and can't seem to run gzip at all. Each time it is run it reports 'out of memory' ! I'm either running gzip.ttp from the desktop (no other memory resident programs) or gzip_xfs.ttp under MiNT v0.95 and a shell (sh.ttp/ash.ttp/ tcsh.ttp/ksh.ttp). Under none of these conditions does it run.

Most of the time under MiNT the shell reports 'file not found' but this seems to happen whenever there's not enough memory to run a process (all other programs (such as ps, etc.) produce a 'file not found' error from the shell when there's not enough memory to run them.) Typing './gzip_xfs.ttp' whilst in the /usr/bin directory produces the 'out of memory' error.

It was suggested that the UNIXMODE variable should be set to something like /rUcub but this has had no effect. It was also suggested that fixstk could possibly solve the problem but it seems that gzip's stack is set at zero already.

Has anyone got any ideas ? I'm going spare not being able to unpack all the gziped files I have lying around ! Of course I could gunzip them on a SUN and then zoo them up - but my zoo won't save file names longer than the 8.3 which is damned annoying ! The minix version of zoo at a.a.u.e doesn't run on my ST - error 'invalid word - expecting a)' or words to that effect !!

Thanks to anyone who can help me !!

Dylan

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Jm-tPUq.lmcclure@delphi.com>
Source record: 32108

In a message dated 6-3-94, Paul Tuijnman said:

"Is there a way to fool the mega into thinking there's a
monitor connected while there's none?"

Of the two standard monitors that connect directly to a Mega ST, the only one it "looks" for is the monochrome monitor (i.e., SM124 or equivalent). If it does not find one connected, it boots up as if you had a color monitor connected to it.

To fool it into thinking you have a monochrome monitor connected, you would need to bring the monochrome detect line on the monitor port low. The easiest way to do this is to connect it to the ground connection on the monitor port (thru a small value resistor, to be safe).

I know mono detect is on pin #4 of the video port, and ground is on #13, but I do not have a diagram showing the location of each pin.

3087. What is RSVE?

Why not simply use a Floptical drive? They r/w DD and HD floppies, they're even cheaper than TEAC SCSI floppy drives, they definitely do work on Atari machines, and they can even do 21 MB on their proprietary type of floppy disk.

bye, Peter

You can get it to do just about any speed you want if you know how to program a Z85c30 and you know the signals. I think the highest anything I've written will do is 230500 or something like that. I know the SCC will do that, but I don't know if the Falcon can really handle it... I've never tried.

> : "=r"(retvalue) /* outputs - any variables that are written */
> : "g"(x), "g"(y), "g"(z) /* inputs */
> : "d0" /* clobbered registers */
> );
> retvalue;
>}
```

(Of course, there was a bit of redundant info in the above example; you don't
need to specify d0 in as many places as I did:)

```
int sum(int x, int y, int z) {
register long retvalue __asm__("d0");

asm("
movel %1, %0
addl %2, %0
addl %3, %0"
: "=r"(retvalue)
: "g"(x), "g"(y), "g"(z)
); /* clobber info is redundant */
retvalue;
}
```

or mebbe, cheating a bit since we know that all we care about is returning
the value in d0:

```
int sum(int x, int y, int z) {
asm("
movel %0, d0
addl %1, d0
addl %2, d0"
: /* nothing written into */
```

```
: "g"(x), "g"(y), "g"(z) /* same inputs */
); /* no clobber info */
}
```

But the first example illustrates all the features...

Linux wants to know what kind of SCSI controller card you have. The host
adaptor concept is unique to STs (at least in this context), and is a totally
different beast. Unfortunately, there is really not an answer to the SCSI
controller question, as the ASCI stuff (Atari's version of SCSI, and that
which the host adaptor translates to and from SCSI) is built into the
motherboard. Experimentation is probably the only way to find out. Note
that PCs don't have built in SCSI (in general), which is why Linux needs
to ask. There are some pretty screwed up PC SCSI controller cards out there.

Hmmm, no clue. I think it is really likely that Linux is not going to
work via emulation, at least not without some major hacking.

RSVE is described (in German) in the file rsve_1.lzh on atari.archive.umich.edu in Utilities/Tosfixes. Basically, it is a small board (trace negatives and instructions included in the above file) and a small program that allow one to have much faster serial communications than the stock 19200 baud available on standard ST/MegaST/STE computers. MegaSTE/TT/Falcon can already go pretty fast, though it is possible that RSVE would do something for these as well.

Thankyou you very much for taking the time to read this.

Hi, I am interested in starting a list of Atari programming information sources. This list will include information on books, magazines, fanzines, technical documents, Special Interest Group newsletters, on-line tutorials, ftp sites, Email mailing lists, telnet services, and anything else dealing with programming on the Atari. I'm looking for sources of programming on anything from programming GEM to programming the MIDI port to programming the DSP in the Falcon and even programming on the Atari 800 if available. I also wish to make a comprehensive listing of hopefully all magazines published to date that deal with Atari, even if the magazine is not published anymore, but if back issues are still available I'd like to hear about it. Also if you use the Atari to program alot, I would like to know about books,etc. that you find useful in your programming, even if they aren't written for the Atari. I would like to get contributions that contain info on any Atari from the Atari 400 to the Jaguar to the MEDUSA040. Basically this list will include any and everything (hopefully) ever written about the Atari (tech stuff on the Atari 2600 will also be gladly taken). Please read below on how to make submissions.

My reason for starting this list is simple I have owned an Atari 130XE for over 9 years now and want to move up to a Falcon or beyond. I've been searching for sources of programming on the bigger and smaller Ataris for awhile now and have found hardly nothing. And no one I know of locally has even heard of the Atari so I'm hoping this list will help people, like myself, who have not been very successful in finding information sources for the Atari. I plan to put all the info I receive on all major Atari ftp sites, newsgroups and any mailing list(s) around, and will keep it updated to the best of my ability. Below is sort of an outline of how I would like submissions to be sent. Thanks again for all your help and I will do my best to make this list the best.

Submission Info::
For Magazines:
o Magazine Name
o Address (for subscription)
o Subscription rates
o Phone number
o type of Atari(s) covered (or type of programming covered,

i.e. M68k, C, Pascal,etc.)
For books:
o Title
o Author
o Publisher's Name (if available)
o ISBN
o Price (if available)

For Online-tutorials:
o Ftp address
o Directory
o Filename(s)

For telnet sites, gopher, www, etc:
o IP address
o Login:
o Pass:(if needed)
o Also instructions on how to find info,
subscribe etc. (if available)

Miscellaneous sources (Mailing Lists, Compuserve, Genie, etc.)
o Anything that isn't already covered
in AEO online for FAQs.
o For mailing lists
- Email Address & how to subscribe (if possible)

And anything else you feel is pertinent.

Email Submissions to: jonewby@unccsun.uncc.edu or jonewby@uncc.edu

P.S. Sorry for all grammar mistakes and spellings errors and also
for the long post. (It's about 2 in the morn here)

3101. Beginning Mint

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-08 08:29:34 UTC
From: news@uncc.edu
Message-ID: <2t3vhe$o3g@unccsun.uncc.edu>
Source record: 32122

I'm interested in really digging into MiNT/UNIX. I've got a Falcon4/80 and would possibly like to install some sort of file system under Mint...I'm also looking into a SLIP connection. Any advice? Right now I'm using Lattice C 5.6/Devpac 3.1 for program development...Does GNU offer me any significant advantages?

And finally, just how portable is code between UNIX and MiNT?

Thanks,
Russ

3103. Looking for 386 emulator for MSTE4

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-08 09:38:09 UTC
From: chan_c@cs.uwa.oz.au
Message-ID: <chan_c.771068289@kultarr>
Source record: 32124

Hello everyone,

I have a some queries. I am interested in getting an IBM emulator
for my Mega 4 STE. Is there any around? The only ones I can find are
286 emulators (AT Speed C16) I remember from somewhere that there
was a 386 emulator produced by (Vortex?) once. Are they still around
and if so where can I get some information on it.

If anyone has any idea of what they are charging for it and their
address (mail and e-mail) I would really appreaciate it if you can
let me know.

Or anyone who knows about it and have used it maybe you could
share some info on it with me. Things like :

Runs Windows ok?
Dos 6.2?
Reads the HD ok?
Serial/parallel ports useable?
monitor emulation modes? (cga/vga/svga?)
what if I have a NOVA graphics card?

etc ...

Thanks in advance

This may sound silly...

Can someone email me how to replace the TOS chip in a FALCON, not the actual removing of the chip, but what screws to take out the bottom of the case and what the chip has written on it, so I dont remove the wrong one.

Source record: 32128

Hi,
since I have a large news spool directory on a minix partition, the
following error occours more and more often:
% touch <newfile>
touch: <newfile>: write failure

The program xsystem tells me that there are 10463 files present in 152
directories.

What's the problem? I thought the limit was 65535 files per partition?

In Lattice C their is a variable set up if you set auto-detecting software on. The variable is int _xmode and will be one of the following depending on the way it is run:
1 GEM program
2 TOS program
3 GEM DA
4 Auto folder program

This is listed in the manual in the Startup Stubs at the back of the book.

Richard Huveneers (huveneer@math.ruu.nl) wrote:
> Also, Linux requires that the SCSI adapter uses interrupts.
> Is this enabled by default in my Mega STE?
> (I sure hope my 386 emulator supports all this kind of stuff.)

I doubt it. Linux is probably using the PC SCSI hardware
directly without intervention of the PC BIOS. I never heard that
PC emulators would support such stuff. Someone please correct me
if I'm wrong.

The host adapters used in the Mega STE differ fundamentally
from host adapters used in PCs. A "host adapter" in Atari-lingo
is a gadget that translates ACSI (=DMA) bus requests to a SCSI disk
drive. This means that you don't have a full SCSI bus, but only
a very limited one, without all the neat SCSI stuff such as
disconnect/reconnect protocols, arbitration and whatnot.

PC SCSI host adapters, together with their driver software, usually
implement the full SCSI protocol. They are much more like the
TT's or Falcon's SCSI hardware. Linux probably counts on a host
adapter delivering the full SCSI protocol.

3114. WANTED: Low level formatter for SCSI HD

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-08 15:18:46 UTC
From: v892307@hillenius.si.hhs.nl
Message-ID: <Cr33vA.6y1@si.hhs.nl>
Source record: 32133

Hi,

I recently purchased a (2nd hand) Quantum 40 Mb. SCSI HD that has
been low level formatted on a PC :-(

The problem is that a normal formatter (like ICDFMT) always does
a Mode Sense & Inquiry to get info like number of heads and cylinders.
This info is probably trashed so I can't format this drive. The formatter
says there are no SCSI devices on the bus, while other utils say there is.

I'm now looking for a formatter that asks the user for the parameters and
does a Mode Select so I can format the drive. I'm trying to write one on
my own, but the only problem is that I haven't got a detailed description of
some of the SCSI-commands, in particular a command to set the following:
- Number of heads
- Number of cylinders
- Numbers of cylinders that need reduced write current
- Numbers of cylinders that need precomp.
- Location of the parking zone
etc.

From my other (working) Quantum drive I only can read the number of bytes
per sector (=512; doesn't surprice me for a bit) with the Mode Sense command.
How do you read and set the other parameters?

Thanks!

Ronald

3119. TT -> MAC (Ethernet) (HELP!!)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-08 22:18:37 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <Cr3nB2.ADB@ecf.toronto.edu>
Source record: 32138
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The subject more or less says it...
I'm looking for any ethernet card (and the software of course!) that can connect my TT up to a Mac ethernet network...
Is there such a product? Is it even possible?!

Why I want it:
I need to send Calamus files to a Fiery Xerox 5775 colour laser copier, which is hooked up to a Mac network. Since I can't directly send my Calamus files to the Fiery (Can I? If anyone has any info in a possible driver for Calamus, or anything, please respond!!!) I want to send them to a Mac in Tiff format, so I can convert and send to the Fiery. Problem is, I can't use the serial port on the TT because it's too slow (some of my files are 40megs and up) so Ethernet is my only solution.

Also, does anyone know if DMC Germany has an email address? I'd like to ask them if Calamus has any drivers to directly send to the Fiery Xerox 5775.

If anyone can help me out on this, I'd be eternally in their debt!!
Many TIA!

There are some German Ethernet cards for TTs. I know they are quite expensive, but they do (or did) exist. I seem to remember a price tag approaching $1000 (this could be totally bogus, like I'm remembering it in D-marks or something, though with today's rates...). Also, there would still be the problem of talking to the printer using the EtherTalk protocol.

> Why I want it:

> is, I can't use the serial port on the TT because it's too slow (some of
> my files are 40megs and up) so Ethernet is my only solution.

Actually, there is at least one other nice solution. You would need:

1 or 2 Syquest drives
Spectre 128/GCR, or perhaps the program MacSee, or perhaps Dos Mounter :-)

Ok, Syquest drives are removable platter hard disks. There are 5.25" drives (44mb, 88mb, possibly larger) and 3.5" drives (105mb, 270mb). Access speed is quite fast (feels like a fixed hard disk). With your TT, you could probably just plug a single drive into it, transfer your file (see below), unplug the drive, stick it on a Mac, and print directly from the Syquest. With two drives, you just carry the cartridge over to the Mac unit and print away. This would be significantly faster than downloading 40mb over a 10mbit/sec Ethernet (even if you had to hike a bit to get to the printer).

One way to write an ST file to a Mac filesystem (on a Syquest) is to use the Spectre 128 or Spectre GCR Mac emulator. All you would really need is the Transverter program, which is included with the above (and might be available separately, or even PD). You would not have to actually emulate a Mac to do this (though you would have to use an old-style MFS filesystem, no big deal for transfers). If you actually emulate a Mac, you would still use Transverter, but could write the file to an HFS partition (which is the normal Mac partition type nowadays). Another way is to use the program MacSee, which I believe allows you to read/write directly to a Mac HFS filesystem while in native ST/TT mode. An early version of this program, called MacRead, is

available from atari.archive.umich.edu (and some info about MacSee is included, I think).

MacSee should be available from Toad Computers, and other places. I don't have direct experience with the product. I do use a Spectre GCR a fair amount on my MegaSTE, and it works very well indeed. Version 3.1 of the software is supposed to be coming soon, which should greatly improve TT support (I think it will work with 3.0, but some desireable features are unavailable).

Yet another possibility would be to use Dos Mounter or other PC mounting utility on a Mac, and write to the Syquest cartridge in native ST mode, depending upon it being a PC compatible format. I think the ICD software formats Syquest cartridges in a PC compatible way. I cannot verify this, but perhaps someone else on the net could. A call to ICD would probably clear it up.

Now, the bare drive for a 44mb Syquest costs about $290 or so, an external Mac unit about $320. For the 105mb 3.5" unit, the bare drive is around $460, an external close to $500. The cartridges for both of these cost the same: ~$60 (all prices in US dollars, recent guestimates)! So, if the TT Ethernet stuff is as expensive as I remember it to be, you could probably get some nifty removable platter drives for about the same price, with much more general utility. The addition of an external ICD Link host adaptor would add another $100, though I suspect you could just plug it directly into the SCSI port on a TT.

I personally own two 44mb drives, and they are great! I have one at home, one at work. I can bring home stuff in 44mb chunks, and keep ongoing Mac work on the cartridge. There are drivers available for PC, Mac, Amiga, Suns, etc. The 105mb drives are even nicer. They spin up significantly faster (about 5-8 seconds, verses ~15 for the 44mb units), read/write faster (the 44mb units go at around 28ms), and the cartridges are quite small (about the size of three 3.5" floppies stacked together). Any Mac peripheral catalog will have these units (they are very popular in the Mac world, not so much in the PC, which is just recently getting reasonable SCSI). Also, Computer Shopper would be a good source.

Lots of folks are upgrading to the 105mb units, so the 44mb ones should not be hard to find on the used market. I bought both of mine, and all my cartridges used, and have not had a problem.

Hope that helps, feel free to email questions.

There is no need for the whole metamail stuff. I assume you mean
something like this:

-rw-r--r-- 1 knarf admin 330454 Feb 28 20:54 contrib-2.4.tar.gz
-rw-r--r-- 1 knarf admin 141392 Mar 3 20:18 mm24.tgz

But all you need to integrate into your application would be the
mpack- and munpack stuff from one of those archives:

-rw-r--r-- 1 knarf admin 41161 Jun 7 18:21 mpack-1.4-pc.zip
-rw-r--r-- 1 knarf admin 96251 Jun 7 18:20 mpack-1.4-src.tar.gz

... which are quite smaller. ;)

mpack/README:

3122. Re: TT Hard drive problem!! (Help!!)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-09 00:27:59 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <Cr3tAq.FCy@ecf.toronto.edu>
Source record: 31992

Like the subject says, I'm in dire need of help concerning the health of
my hard drive!!
Okay..some info first:
The drive is a Quantum Pro-drive ELS, SCSI-1, 80 meg harddrive.
The drive is partitioned with BGM partitions.

The problem started a while back when a friend of mine was trying to save
onto the drive and got a "Output device not receiving file" message.
He tried to fix it using Diamond Edge, but inadvertently he _might_ have
deleted out the entire partition. Whatever it is, no files show up in the
partition anymore...leading me to believe that the FAT is probably screwed up.
Now, nothing can even read the partition!! And yes, I tried fixing it with
Diamond Edge, but it couldn't access the drive.

My problem:
How in the heck do I fix this??!? I ported the drive over to my Pc-compatible
(which happens to have a really nice auto-config scsi card) and _did_
manage to find out that data still exists on the drive... I need to know how
to get it!! Incredibly valuable data files exist on the drive!! (argh!)
Anybody out there have any ideas? Can any software (ala Norton Utilities) out
there solve this problem? Is there anything I could use on the Pc-compatible
platform that could _understand_ BGM partitions and fix this problem?

If anyone has _any_ suggestions, please respond _please_!
Manymanymany TIA.

DT>
DT> Any ideas anyone?

BinkleyTerm or Semper using the external BTFAX driver work's but that's receive only. For reliable sending (and receiving) you really need to be looking at StraightFax2 which support's The Supra very comprehensively (CallerID,Silent Answer etc).

Great Atari ST games & stuff for sale!

GAMES:
For $5/each game:
Arena, Deep Space, Barbarian, Obliterator, Terrorpods,
Mr. Heli, Forgotten Worlds.

For $15/game
Wrath of the Demon, Awesome, Wanderer 3-D.

Compilations:
"World Beaters"--Outrun, Gauntlet II, 1943, Street Fighter-- $20
"Sega Master Mix"--Super Wonder Boy, Turbo Outrun,
Crack Down, ThunderBlade, Dynamite Dux---------- $20
"Triad II"--Menace, Tetris, Baal---------- $15
"Triad III"--Speedball, Blood Money, Rocket Ranger---------- $15

EMULATORS:
Spectre GCR (MacROMS includes) v.3 ----------$199

FLOPPY DRIVE:
Future Systems' double density GTS-100 3.5" drive with LED
track indicator----------$90

MISCELLANEOUS ST STUFFS:
Mega ST keyboard ----------$15
Atari Mouse----------$20
OMNISWITCH (connects the ST/STE to any Multi-sync monitor)---$20
ULTIMATE RIPPER: this cart lets U break into any program,
disassemble, freeze any screen pix, etc! U'll love it!-------$40

BACK-UP your copy protected games with:
TURBO BLITZ (software & cable)----------$15
SYNCHRO EXPRESS (software, parallel port cart & cable)-------$30

buyer pays shipping

On the topic of Syquest drives, you'll notice (in recent issues of Computer Shooper, anyway) that the 88MB drives and platters are actually cheaper than the 44MB units. I guess 44MB units aren't being made any more. (Small loss, the 88MB units can read the old platters, and are faster anyway...)

I haven't really had time to form much opinion on the new 3.5" 105 MB units...

You are right. I bought it two or three years ago. It is called ATonce-386sx.
I can't imagine it is not sold anymore.

> Are they still around
> and if so where can I get some information on it.
>
> If anyone has any idea of what they are charging for it and their

> share some info on it with me. Things like :
>
> Runs Windows ok?

Windows 3.1 runs fine. Perhaps a bit slow.

> Dos 6.2?

Yep. Runs fine too. The only problem I experience is when using DoubleSpace, I can
only access DOS partitions C and D. I just don't use DoubleSpace.

> Reads the HD ok?

Yep. As long as you keep your partitions smaller then 32Mb.

> Serial/parallel ports useable?

Yep. Never experienced any problem with my printer (LPT1) or Portfolio (COM1).
By the way, your Atari mouse becomes a Microsoft compatible mouse.
I have it configured on COM2.

> monitor emulation modes? (cga/vga/svga?)

Yep. Yep. No.
Available emulation modes:
On a monochrome monitor: cga/ega/vga/hercules/olivetti
On a color monitor: cga
How do you ever want to emulate svga on a 640x400 monitor?

> what if I have a NOVA graphics card?
>
I don't know anything about graphics cards. Sorry.

> etc ...
>
Perhaps interesting: QEMM386 and EMM386 work.

Hope this helps,

Richard.

>significant advantages?

Well, your hardware is up to it, though it would probably be even better if
you had more memory. (What! 4MB not enough! :-))

What you'll have to do is partition your drive into at least two partitions,
one for TOS and the other for the Minix filesystem. If you wait for MiNT
1.11 you'll be able to merely download and install all the utilities needed
to get both a compiler set-up and a full SLIP internet connection using
MiNTNet, 0.4{1,2} has TCP support now and various utilities are currently
being ported, I believe telnet, ftp etc. are already.

GCC has the advantage of being the main development compiler for the MiNT
libraries and software. There is limited support for Pure C and very limited
support for Sozobon C, but that's it.

>And finally, just how portable is code between UNIX and MiNT?

Using GCC and the MiNT libs code is very easily ported between Unix and
MiNT, the only real hurdle is the lack of a non-blocking fork(). The
libraries lean towards the BSD camp rather than the AT&T/USL System V camp.

How many i-nodes are free? On initializing the filesystem a fixed region of the disk is reserved for the i-nodes, and you need one for every file or directory. Normally one i-node per 3KB is allocated, it looks like you have a 30MB partition.

From: dbanarse@sees.bangor.ac.uk
Message-ID: <2t6nef$sc5@clss3.bangor.ac.uk>
Source record: 32002

I'm finding it a little difficult transferring large msa files (such as some of the PD demos) to my ST. The problem is that they won't fit onto a standard DOS 720K disk - my ST only has a DS DD drive. Compressing the files doesn't usually have much effect at all.

I'm sure there must be people out there who have been in the same situation.... how do you get around the problem ??

Cheers for any help !

Dylan

Ooops! I just dicovered that this message was an error.
So please ignore.

Greetings: Gerald Huber

3136. Linux for Falcon030

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-09 11:14:57 UTC
From: michrm@central.susx.ac.uk
Message-ID: <2t6tjh$3ha@infa.central.susx.ac.uk>
Source record: 32003

I remember that someone here posted saying that a version of Linux was available for the Falcon (I think it was on a german ftp site). Can anyone help me...I would like to have a play with it over my long summer holiday.

Thankyou

Michael

Hi great ignorers !
I am really honoured to ignore this posting. It was a pleasure.
What about a new newsgroup comp.sys.atari.ignore ?

3139. GFA Basic question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-09 12:13:50 UTC
From: ceebsm@cscd4c14.caledonia.hw.ac.uk
Message-ID: <Cr4pz3.CJA@cee.hw.ac.uk>
Source record: 32007

I'm not sure if this is the best group to post in but it's worth
a try. What I want to do is access ENV variables from GFA Basic 3.5e

I would like to have a variable called GFASOURCE which is the folder
in which GFA files are held. This would be accessed by a program I
am currently writing. If anyone can tell me how to do this then
either mail me direct at the address below or post a reply here.

Cheers

Barry

Sorry to deflect the topic slightly already but ...

How do you go about writing a printer driver ?

Is it best to get a book on the topic ?

How long would it take roughly and is it that difficult ?

Thanks and sorry I don't have a printer driver for the Epson
stylus 300 inkjet printer.

Ronnie

I don't want to be rude, but forget it. Right here, right now, unless
you plan on rewriting _huge_ chunks of the innards of that none-too-
-pleasant operating system.

The 386 emulator is designed to run DOS, and maybe Windows.
Interface to the disk is _probably_ handled by a set of custom
BIOS routines, which understand the ST hardware.

Linux won't.

>Richard.

>I haven't really had time to form much opinion on the new 3.5" 105 MB units...

At work we have a 3.5" optical drive on one of our PC's. 128mb and
rewritable as well. The speed isn't too quick, maybe a bit faster than a
floppy.
I wouldn't mind one myself but I bet they are rather expensive!!!
(I think the disks are 50 pounds each, no idea about the drive)

I don't think the MegaSTE is born with a scsi adaptor. A few friends
of mine had to add this to their machines. But it was some Atari kit
they bought which suits the MegaSTE.

Btw.. Where did you get linux from.. I'm searching it as well ??

Try using the Splitter program by Stu Coates. It can take files of any
size and split them into smaller chunks, ready for transfer onto floppy
to then transfer over to the other machine. It's available for the PC as
well so you can even copy across platforms.

> MB> working on a MegaSTE?
>
>Isn't there a software only solution for the STE that increases the horizontal
>resolution ?

I dunno about horizontal, but the program DOUBLE2 allows any STe user to double the *vertical* resolution, so that you could have (onscreen at one time) 320x400x16, 640x400x4, 640x800x2 (corresponding to ST Low, Medium, and Hi). Unfortunately, it does this by INTERLACING which, to say the least, is wicked to the eyes, particularly if you're trying to read text...

It will also do double-horizontal resolution without interlace, but then you have to scroll the screen to see it all...

The other option is MonSTEr, which will let you double the horizontal and vertical resolutions (effectively quadruplizing the screen), but this as well means you have to scroll the screen up and down, left and right to see the whole thing. The nice thing about this is that you could say see Nethack in full 16 colors on a plain ol STe in 640x400 mode, etc...

One way to do it is to uuencode the file, then split it using a text editor into reasonable sized chunks. Then you simply recombine them with an editor on your ST, assuming you have either enough memory, or a hard drive..

The uuencoded file will end up larger than the original compressed file, but that's life..

Keith.

Dear Atari Creatures:

What we have here...is a failure to communicate.

I'm logging onto a 7/8bit University telnet system (run on Telebyte modems) with my Mega 4 STE, my BRAND NEW U.S. Robotics 14,400 Sportster V.42bis Fax Modem, and STalker v.3.02. I have the fixes from HSMODEM04 installed, even though I'm only running set at 19,200 baud, 8bit, no parits, one stop bit.

No matter what I have tried, DOWNLOADING from my telnetted accounts here, I invariably--I mean absolutely every time--get errors EVERY 4096 bytes--starting at byte 4096--with Z-Modem. My transfers have slowed to around 510cps as a result. My transfers TO Penn, however, have gone like lightning--102% efficiency, over 1200cps. V.42bis on both ends. Go figure.

I've changed every variable I could think of or someone could suggest, except logging onto another system--everything's either disconnected or busy. I've played with the flow control, tried logging in at 9600 baud, and used standard Kermit, Z-Modem, and X-Modem. Everything but Z-Modem gives me no errors at all, but at best a 535cps transfer rate.

I have used the U.S. Robotics template setting, AT&F1, which made no difference whatsoever. Where I come from, if you can reproduce an error every time, that means there's a bug in the woodwork somewhere. Both mail.sas and ccat.sas have given me this problem, and I've use rlogin, telnet, and the tn3270 protocols to reproduce it. I thought that perhaps it was the STe's serial port buffer--but every 4K incoming? And the error message reads "NAK received from remote host." Every 4k. At least I can transfer the big files in, but not out. Not at anything better than 10-20% of capacity.

HEEEEEEELLLLLLLLLPPPPPPP!!!!

I compiled MiNT 1.04, 1.08 and 1.09 with Lattice C with no problems. I had to frig up a proper makefile (I don't use the Lattice .PRJ stuff), but it all compiled cleanly and works.

You didn't say what you are transferring *from*, I'll assume Unix:

I used to get around this by transferring large files to tape (I get my
stuff on a Unix system, so use tar to copy it to tape), and then read
the tape on the ST (GNU tar). However, I do not have a version of tar that
works on the Falcon, so...

The last time I had to copy a file too large for one diskette, I split it
using the Unix utility split(1). Then it was just a case of using cat(1)
on the ST to rejoin the parts.

3158. Genlocks?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-10 12:06:57 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <2t9l11$ncp@infa.central.susx.ac.uk>
Source record: 32025
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Can anyone recommend a (cheap) genlock for my 4M STE (Tos 1.62). I would like the software to be able to be upgraded (so possibly modular). I would also like to be able to control graphics in real time if possible (eg moving a circle around the screen by moving the mouse).

Or better yet, if anyone has a very cheap genlock for sale that I can get started on, then I could be interested in buying. But it must be compatible with UK configurations (240V and PAL tv).

Thanks in advance.

Andrew Collington @ Sussex University, Falmer.

I have a copy of dBMan version 5.30 NI which, after running rather well over the past 2 years has developed some quirks - most notably the "type" function call:

i.e. print type (srch("M",key)>0) prints an L for logical,
print type (100) prints an N for numeric, etc.

stopped working. I reloaded the complete package from my backups, then from the distribution disks and it still doesn't work.

Would anyone have any ideas why this would all of the sudden stop working? Would anyone know the latest version # for dBMan?

:> > about 32bits ?

They are 256*32, so there's no way to get it working. You could expand a
520 ST to 1MB, though...

:> You need 8 bit SIMMS, or mod the STE to use 9 bit SIMMS, the unused 9th
:> bit must have the inputs terminated to 0v or +v, so just connect pins
:> 28,29 and 30 together....pin 30 is +v....

Nonsense, you don't need to pull them up. They can be left open. No problem.

From: ktessner@isle.waterloo-rdp.on.ca
Message-ID: <1994Jun10.151148.101@isle.waterloo-rdp.on.ca>
Source record: 32151

I am writing a specialized FLC player for a video production project of mine and would like to do it in ST-Low mode, with overscan, 256 colours (for the sake of a borderless video, and the fact that the FLC format which I can readily render to is 256 colour only). I need to know how the memory is laid out and the exact resolution I should be rendering for (I am aware that the visible range varies from monitor to monitor, but I do need to the know the bitmap size in pixels for the sake of the renderer).

A reply here with this subject or private email replies are fine.

> scan frequenties) to my ST in hi-res. Just wire the mono-out from your st
> to red, green and blue in on your SVGA monitor and connect the mono detect to
> ground. Of course you must connect h-sync and v-sync too.

AFAIK that can be dangerous. The mono-out signal is TTL (ie: near 5 volt) and
the RGB lines to a VGA/Multisync expect 0-1volt variable. Now if you set up
a voltage divider to cut the 5 volt down to 1 volt (say a 1k and a 3.9k
resistor (I don't recall now if 3.9 is a standard value) before feeding it to
the RGB lines you should be okay. (Of course, a good monitor should have
protected inputs anyways and it sounds like yours does).

Thank you for the people who have responded to my request concerning
putting a 2.5inch IDE hard disk into a normal Atari STe (TOS 1.62) -
any more help on this would be appreciated.

Some people have mentioned something about a board called a speedbridge -
does anyone know anything about this?

Also - it seems that i need TOS 2.06 - why would this be?

> the 88MB units can read the old platters, and are faster anyway...)

My latest Computer Shopper has $98 for 88mb carts, verses $69 for both the 44mb and 3.5" 105mb ones. The 88mb bare drive is $259, and a combo 44/88/200mb 5.25" drive is $409. It does appear that the 44mb drives are no longer available new (though all the Mac catalogs still have external 44mb units for sale, lots of stock I guess). All this is from the Dirt Cheap Drives ad (gotta love that name).

Older 88mb drives could only read the 44mb cartridges. The newer units can read and write them. The 200mb drive can read and write all three (apparently Syquest wised up about this). It appears that all their new drives are completely backward-compatible with older cartridges of the correct size. I'd really like to try and reformat one of my 44mb cartridges to 200mb (probably wouldn't work due to inadequate media density, but it would be _really_ nice if it did :-).

Also, I noticed that another poster mentioned that he/she has a 3.5" optical drive on a PC, and that it is very slow. Note that all the Syquest stuff is standard magnetic media aluminum platter etc. etc., and they all run quite fast (certainly faster than floptical/cheap optical stuff that is currently available). Access speeds run between 13-20ms on all current Syquests (the 44mb units run at around 25-28, if I remember correctly). In other words, they feel like regular fixed disks. The only real annoyance is the spin-up times on the 5.25" units, but that is easy to get used to. The 3.5" units spin up really fast (smaller diameter platters = speed, I guess).

Anyway, the moral of the story is: Syquests are cool (IMHO).

3167. Hard Drive help needed!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-10 19:13:41 UTC
From: fuhrman@cray-ymp.acm.stuorg.vt.edu
Message-ID: <2tae15$hf0@solaris.cc.vt.edu>
Source record: 32040

I recently purchased a SCSI 45MB Seagate (ST157) for my 4MB MSTe (Tos 2.5). Since the Computer came with the Hard Disk kits installed, it was really a simple matter of plugging the thing in, inserting my copy of Atari's Hard Disk Driver (Ver. 5) and booting up. The problem I'm having is that I can't get the computer to recognize the hard drive.

Here's what happens if I boot up:

1) Without a disk in the drive

Need to hit return to get the computer to boot from ROM. Desktop comes up in ST-Low with ONLY the trashcan icon. The computer does not recognize either the floppy or the hard drive

2) With a boot up disk with ahdi.prg in the AUTO folder.

When the driver displays it's stuff on the screen reports that ACSI 0 is *not* bootloaded. Computer boots with standard 2 drive + trashcan desktop. HDX.PRG (when I run it) does not recognize a device at Unit 0.

(Special Note: This happens whether I boot up with or without other TSRs in the AUTO folder. I usually boot with a couple serial patches, a serial buffer expander, and Quick STe 3)

I've made sure that the adhi.prg DOES support SCSI and I've tested the drive itself in another computer to make sure that it recognizes it so nothing appears to be wrong with the drive itself. There are *no* jumpers on the drive so parity is not enabled and the thing's set to Unit 0.

Through the process or elimination, I've pretty much come to the conclusion that the problem lies in either:

1) The Hard Disk Controller

2) The computer itself

Can anyone with similar problems verify my reasoning here or tell me what *might* be the problem? I've not been able to get this drive to work for the past month and am finding this *very* frustrating! Thanks in advance!

If it has no jumpers, my guess would be that parity is enabled, not disabled.
That is a guess, however. A call to Seagate would probably clear this up.
Their number is probably listed in the 1-800 number directory (1-800-555-1212).

Some early STE computers had major DMA problems, but I am not sure if any
of the MegaSTEs did. Mine is a fairly early model that has been upgraded
to TOS 2.06, and I have no problems. I do not use the internal Atari
host adaptor, though.

>dbanarse@sees.bangor.ac.uk

Use the Later MSA 2.32, this will format the disk for you....

A lot of people don't use the 720k format, some use 82 tracks and some use
11 sectors and 82 tracks, this gives over 900k......

Some drives don't like 82 tracks and some drives don't like
11 sectors, drives that run slower than 300rpm can use 11 sectors...

Or why not just use the SHEL_ENVRN() call, as that's what it's for?

~SHEL_ENVRN(addr%,"ENVVAR=")

will return the address of an environment variable that starts with the
text "ENVVAR=". Since env vars are null terminated, you can read the
string itself with:

env$=CHAR(addr%)

(addr% will be zero if the requested env var does not exist)

Sorry, can everyone repeat the above as I ignored it, and I enjoyed it so
much that I want to ignore it again.

I just had to add my own contribution to this wonderful thread,but if you
don't like it then you have my permission to ignore,and pass it on so
your friends can too.

But if you ignore it on a regular basis then can you please send me the relatively small amount of 10 pounds. Quality ignores like this are often far more expensive, so it's quite a bargin!

:-)

Mr. Roman Hodek

I have a copy of the FSER96B. I would like to try this product out.
If it works I will pay the shareware fee. I have just purchased a new
ZyXEL, U-1496E Plus and would like to use all of its power.

Are there are any English docs available? I if so please, Email them
to me. If not could you have someone outline the setup for a TT030,
with TOS 3.06, and the before mentioned modem.

Also keep in mind that files can be compressed to fit on the Syquest drive if what you are transporting exceeds the capacity of the drive.

: Use the Later MSA 2.32, this will format the disk for you....

: A lot of people don't use the 720k format, some use 82 tracks and some use
: 11 sectors and 82 tracks, this gives over 900k......

: Some drives don't like 82 tracks and some drives don't like
: 11 sectors, drives that run slower than 300rpm can use 11 sectors...

Hey, wasn't there some program for the ST what would COMPRESS disks, was more reliable than MSA, and didn't require you to swap disks for every track that was decoded?

Wasn't it Jampacker or something like that? It's been a long time.

Rob S. Rice (rrice@netnews.upenn.edu) wrote:
: Dear Atari Creatures:

: What we have here...is a failure to communicate.

: I'm logging onto a 7/8bit University telnet system (run on
: Telebyte modems) with my Mega 4 STE, my BRAND NEW U.S. Robotics
: 14,400 Sportster V.42bis Fax Modem, and STalker v.3.02. I have the
: fixes from HSMODEM04 installed, even though I'm only running set at
: 19,200 baud, 8bit, no parits, one stop bit.

: No matter what I have tried, DOWNLOADING from my telnetted
: accounts here, I invariably--I mean absolutely every time--get errors
: EVERY 4096 bytes--starting at byte 4096--with Z-Modem. My transfers
: have slowed to around 510cps as a result. My transfers TO Penn,
: however, have gone like lightning--102% efficiency, over 1200cps.
: V.42bis on both ends. Go figure.

: I've changed every variable I could think of or someone could
: suggest, except logging onto another system--everything's either
: disconnected or busy. I've played with the flow control, tried
: logging in at 9600 baud, and used standard Kermit, Z-Modem, and
: X-Modem. Everything but Z-Modem gives me no errors at all, but at
: best a 535cps transfer rate.

: I have used the U.S. Robotics template setting, AT&F1, which made
: no difference whatsoever. Where I come from, if you can reproduce an
: error every time, that means there's a bug in the woodwork somewhere.
: Both mail.sas and ccat.sas have given me this problem, and I've use
: rlogin, telnet, and the tn3270 protocols to reproduce it. I thought that
: perhaps it was the STe's serial port buffer--but every 4K incoming? And
: the error message reads "NAK received from remote host." Every 4k. At
: least I can transfer the big files in, but not out. Not at anything
: better than 10-20% of capacity.

: HEEEEEEELLLLLLLLLLPPPPPPP!!!!
:
: Rob S. Rice

It is possible that some connection along the way is catching something coming
from either side and screwing up. Using rlogin (which isn't supposed to
filter any characters), if I login to one machine, then rlogin to another and
download a file, the transfers become unreliable. On occation, large
transfers will screw up royally at about the same place each time, and I have
not tracked down the problem.

The solution for me is to rlogin directly from the modem bank to the machine I want to download from.

From: bbs.ruscal@tsoft.net
Message-ID: <NJ3qNc1w165w@tsoft.net>
Source record: 32168

Howdy...I recall a posting quite awhile ago that detailed the modifications required to make the Spectre work with the TT. I don't recall if the mods were for the GCR only, or both the GCR and 128.

Also, does the Spectre understand the TT's 19" monitor ?

Oh, whatever happened to the infamous Spectre 3.1x update that was in the Real Soon Now hall-of-flame ? Was it ever released ? WHat were the actual features ?

All my sudden interest due to getting an 8MB TT...

Was Unix System 5/Release 3.x ever released for the TT ? 'Tis a shame there's no Ethernet port on this; Seems to have eveything but the kitchen sink built in...

Thanks,
-Russel (Unwitting owner of a 32MHz TT w/8MB RAM...what the hell do I do with it ?!)

Definately, there are at least 5 Atari specific Atari CD's around and of
course you can access the wealth of CD's with GIF/WAV files on them, plus
being able to play an audio CD into the Falcon's sound ports, and remix
it live it very nice.

Just grab a copy of FolderFix and set it to, say 100, and then your
problems are over, as this will fix the memory violations.

No, but it's been in beta testing for almost a year now.

AFAIK, MultiTOS still ships with MiNT 1.04 (1.10 is current, and will be
replaced by 1.11 in the next couple of weeks) and AES 4.0.

Why not? The E key for select all?

TM> Don't ever use any software that uses Shift-Backspace to delete a line.

Ctrl-Y is much better, what do you think of some wordstar codes like Ctrl-K..
in text editors?

Hm, am I ignorant or what? I have NOT been ignoring all the above. In fact
reading it all have given me so much that my whole view upon life and it's
mysterious ways have been enlightend. Reading it has influenced my mind so
much that I'm considering to take up Hinduism as religion in my next life!

I therefore strongly advise you ignorant ignorers to reconsider your ignorance, and read all the above with an open mind and seek the deeper meaning of it all. Then maybe you'll all get a present from Santa at X-mas even if you've not been nice in your previous lifes!

The enlightened!

3200. Multisyncs: are they fussy?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-11 19:31:54 UTC
From: irf1001@cus.cam.ac.uk
Message-ID: <2td3fa$mct@lyra.csx.cam.ac.uk>
Source record: 32170

Does anyone have any experience of using multisync monitors, other than the famous NEC II, on an ST?

I'm considering building a switchbox for a "Walters" multisync, in an attempt to hook it to a 1040 STFM, but I'd rather know first if this is a doomed exercise...

Thanks

> Can I use the mainpart of my (serious) atari
> software on a 486DX-33 PC with a SVGA-monitor and internal modem?.
I only use PD-sofware. This software works great and fast. I've got a
486DX-40 also with a SVGA-monitor but with an external modem.
> What about the HD? And the parallell/serial/SCSI/xxx ports?
You can only use a 32mb partition. If you don't have one, the
gemulator makes a virtual one, no problem. You can attach a printer,
again no problem. The serial interface is a little bit more
problematic. I've had problems using my modem with a speed greater
than 9600bps. The gemulator only uses com1 or com2 for emulating (no
other comports are useable)

You can't use a network and you can use only 4 partitions alltogether.
You will have problems with any hardware for the ST. IMHO the
Midiport doesn't work either.

If you use only serious software the following doesn't apply to you.
One problem of the gemulator seems to be that it doesn't support a
joystick.

From: slh100@tower.york.ac.uk
Message-ID: <Pine.3.89.9406120029.A6996-0100000@unix>
Source record: 32175

I am working on some code for a text editor, which at the moment uses Bconout(2) for screen output. I have seen a lot of Emacs editors which use small fonts on an ST high rez screen: how is this done? I would like to be able to set the font size, and also have some reliable way of finding out screen width and height (in characters) whatever the graphics mode. I know how to do both these with the VDI, but this is too slow and will not run under Toswin.

Shawn Hargreaves "God is real, unless declared as integer."

As I use Flash 1.6 most of the time, I need a shell
that supports GSZRZ 3-4xx.. (Zmodem)

I can use Flash 1.6 to dnload files, but not to upload them,
no file selector support..

So were can I find a shell for this..??

For some reason or another my STORM no longer works, could be ASspeed,
NVDI or HSMOD4, I have yet to find out, all files seem to get corrupted,
the same happends to C-Kermit, plus I can't get C-Kermit to upload at all..

This is why I wan't to stick with some thing that I know works...

Flash 1.6 with GSZRZ....

Thanks......

It is but AHDI doesn't support a second IDE drive. You need HuSHI or
HDDRIVER in this case (both German products).

**** HELP ****

I am still trying to install J_OFFICE on my 'D' drive.

I know about changing the ACC to a PRG and holding the ^ Key Down,
but what path am I selecting...??

The same with J-OFFICE.PRG, its asks for 2 Paths of what.??

I just keep getting a dialog box with some thing about a Module..!!

Gee when are we going to get English versions of this software..

The same with COMA, NO ENGLISH DOC's = NO MONEY...

I can't even read what I am asked to send for COMA..??

Zuerst die Gebhren:
Vollversion CoMa ohne Handbuch DM 89,-
Vollversion CoMa mit Handbuch DM 99,-
Vollversion CoMa, nicht EU-Staat DM 109,-
Vollversion CoMa und Voice mit Handbuch DM 149,-
Vollversion CoMa und Voice mit HB, nicht EU-Staat DM 159,-
Upgrade CoMa auf Voice DM 50,-
Upgrade CoMa auf Voice, nicht EU-Staat DM 60,-

PLEASE PLEASEwhat does this meen..??

Looks more like a shopping list to me....

But I don't intend to sent any FEE with out English DOC's..

Please you German authors, please wake up and write English doc's for your
programs, that is if you meen to sell them..??

Does any one know when there will be a Demo version of Strait Fax II..??

I would like to try before I buy...

Seems like that is the only decent English Fax Program there is for the
Atari..??

Can any one Help..??

From: selick@acs4.bu.edu
Message-ID: <2tfsmq$ecj@news.bu.edu>
Source record: 32188
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anybody out there have GCC running on their GEMini CD-rom disc from Walnut Creek software? If so, could you send me your setup file with the environmental variables all set up? Also, var's for anything on the disc would be helpful. What drive do most people put the cd on? I'm on drive P at the moment, and TCSH doesn't recognize it.

Thanks,
Steve

A friend has just come into ownership of one of these and I can't seem to
get it to work with my ancient hard-drive software. They only let me
format up to 16 megs a partition, is this actually a maximum? or is it
just the limitations of the software? The drive is 105 megs.
There are a set of 8 jumper switches near the i/o connections of the
drive, will these have any significance to anything and if so what?
Does anyone have the correct settings for these?
I've got the details for the drive such as the write comp and stuff, but I
still can't get it to work :(.
Does anyone know anything about these things, and if so can someone help me?
I'd really appreciate it.
Oh btw the host adaptor is a berkeley micro-systems bms-100 if anyone's
ever heard of one of these.
I know I haven't ;). Apart from mine that is.

Thanks for any help anyone can provide,

Paul

I have heard nothing but rave reviews for Straight FAX. It is reputed to
be very nice indeed. That said, I have not seen a demo version either.
I'll call Toad tomorrow and see if one exists (and if they'll send it to me).
If they do, I'll stick it on atari.archive.umich.edu.

3215. Music Compression

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-13 06:26:08 UTC
From: ekl@sdf.lonestar.org
Message-ID: <CrBoJK.80s@sdf.lonestar.org>
Source record: 32063

Lately, I've had this idea about a simple way to create sine wave for output with DMA sound. The basic formula is :

```
buffer[index] = sin ((hz * index)/(2*PI)) * amp;
```

This assumes that index is a loop counter and buffer is sufficiently large to hold the entire wave, which is found by taking the sample rate and dividing it by "hz", which is the frequency of sound you want to create. Amp is the amplitude, up to 127, since the equation is for signed.

Now, the beauty of this is that with table driven math you can do it fast, and you only keep 1 sine wave in memory. To play the wave to any desired length, you use the MFP and DMA Sound in event count and repeat mode (respectively). This allows you to use very small amount of data, meaning you can do mixing and such in real-time and more complicated things to the sound since you are dealing with a very low volume of data.

The problem arrises that you are restricted to integer divisions of the sample rate for your playback frequency. Hmm .. that isn't what I meant. Your frequency of sound is gonna be sample rate / bytes, where bytes is the number of bytes per sound wave, which was worked out above.

You can't get most of the frequencies you need to the degree of resolution required by the human ear (+/- 3 Hz) High C on the piano is 4186Hz. Go ahead, do the division. You can only get 4172Hz, which is alot flat. This doesn't even count harmonics/overtones, which I HAD wanted in the original idea of 1 wave being repeated. The fact is that you can't do it this way. You have to calculate how long you want the sound to last and then calculate the wave across the whole blockof bytes. Otherwise you won't get any accuracy of pitch, this can require 10s of thousands of bytes of data. You can cut this down to a few thousand bytes by using a combination of techniques, basically you store 21 waves, instead of just 1, and work the math from there. 21 waves is almost sufficient, but at low notes it results in TONS of repeated data, which is what I wanted to get rid of in the first place.

Now, is there something that I'm missing? I need a way to solve the problem. I've been thinking about using dual block sizes and storing 1 wave in 2 different size blocks which would alternate repeat. its weird, and I haven't worked out the math yet. I justed wanted to know if anyone has any magical cure for this. The idea of 1 wave being repeated by teh hardware to cut down on data is just wonderful, but only for low notes :-(

MM> I remember that someone here posted saying that a version of Linux
MM> was available for the Falcon (I think it was on a german ftp site).
MM> Can anyone help me...I would like to have a play with it over my long
MM> summer holiday.

I can't help you out with an ftp site, but I do know that last night something advertising itself as Linux ST came over one the file echoes on a local NeST/Fidonet board. Find yourself a local board and see whether they've got it. If not, it is certainly available for d/l at STandard BBS (0394 271550).

The description says it requires GNU C + the Minix filesystem. It's also only 800K long, so I don't know whether it's the genuine article.

ATB,

Martin

Not if you are running MiNT, as the dynamic memory handling in MiNT is
completely different to the GEMDOS version. FOLDRxxx is only a fix for
the GEMDOS dynamic memory routines.

Take your pick, with MiNT running or not you have a huge choice. You can either use an all in one solution or a pure shell like a bourne or Korn shell and then add utilities, man pagers or whatever as you need. Check out a MinT FTP site for an idea as to just how much is available.

It's Darek BTW, but YES! Lets see the Xformer on the Falcon. Maybe with
the extra memory on a falcon it is even possible to emulate a MARS 8 ;-)

I've seen the source on a local BBS, but never downloaded it, so I am
not sure how much work is involved.

> ** 27KHz...Dave **

Well, yes and no! The scanning frequencies support the Falcon's
TV/RGB modes (15.75kHz horizontal/50Hz vertical), so it could do
both True Color and monochrome at 640x400, but INTERLACED. The
Falcon only supports up to 640x200 or 320x480 in True Color in
non-interlaced modes and ST mono requires a monitor with a
horizontal scan rate of 31.5kHz and a vertical scan rate of 72Hz.

>Is there one for the FALCON, if so where from?

Nope. ST XFORMER is an 800/XL/XE emulator, but it doesn't
run on the Falcon030. However, it's a PD program and some
people are about to get ahold of the source code to see if
they can make a Falcon version of it.

There are Speedo fonts supplied with X Windows. However, there are
different ways to encode ('encrypt') a Speedo font, and Retail Speedo
engines (SpeedoGDOS, WordPerfect for DOS) will not read a PD Speedo
font.

You may want to look at the X11 sources to try to figure out the
PD format.

If you have a Seagate ST225, then you only have a 20 meg HD. Where did
you get the figure of 105 megs?

3234. Mono monitor switch question

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-13 13:40:38 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <2thnkm$mkp@infa.central.susx.ac.uk>
Source record: 32061

I have an SM124 high res mono monitor and a tv. I keep the tv ariel plugged in all the time because the computer automatically detects if the monitor is plugged in and uses it if it is (as you all know!). What I want to do is keep the monitor plugged in all the time, but use a switch (SPST) to turn the monitor detection on and off.
How do I do this as I have not got a pin out of the monitor connector.

Thanks for any help.

3235. Sound sampling

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-13 14:04:13 UTC
From: marc@v2.rl.ac.uk
Message-ID: <2thp0t$28vp@unixfe.rl.ac.uk>
Source record: 32062

Anyone know how I can use my ST as a simple sound recorder/muck-about'er/play'er??

I've got a really, really, REALLY old 1040STFM and a 520STM - the 1040 would be the machine I would use, but I just want to be able to plug in a sound source, record it (within the limits of the memory, obviously) and muck around with it; reverse it, possibly add effects and then play it back out.

Best solutions would be ideas as to how I could physically connect a source; would I need an A/D converter?

I could probably tap into the audio out pin of the monitor socket for output, but I remember that getting the correct pattern for the plug was a problem. Is this still a major problem?

Also software: is there some that I can get cheaply (ie. FTP sites) or some that you can recommend in the shops?

Thanks in advance.

Why not just go and buy one of the many different sound sampler cartridges?
The cheaper ones in the UK are around 35-50GBP or less (especially at shows where
they are often sold at 20GBP).

Too bad. I know you are wildly enthusiastic about this program. What is
ASspeed, BTW?

> This is why I wan't to stick with some thing that I know works...
>
> Flash 1.6 with GSZRZ....

How about Connect with GSZRZ and Selectric, which should allow you to do
multiple file uploads with no problems? Connect has built in support for
GSZRZ, in addition to its excellent internal Zmodem. It also works perfectly
with NVDI and HSMODA04. Be sure to get version 2.46, and the update for
the Zmodem stuff. They both exist on atari.archive. Another alternative
would be Uniterm, which can support GSZRZ with a minimal set of macros.

>Nonsense, you don't need to pull them up. They can be left open. No problem.

They just burn out (hopefully unnoticed) but they can take the other chips
with them in their graves... Please pull up ! When connecting a high
impendance scope onto these not connected terminals you can see what
happens. Try pointing with your finger toward the pins.... The input swings
up and down with the frequency of the mains..
The unconnected chips can become quite hot when left floating...

greetings,
Gert

Dear Atari Creatures:

What we have here...is a failure to communicate.

I'm logging onto a 7/8bit University telnet system (run on Telebyte modems) with my Mega 4 STE, my BRAND NEW U.S. Robotics 14,400 Sportster V.42bis Fax Modem, and STalker v.3.02. I have the fixes from HSMODEM04 installed, even though I'm only running set at 19,200 baud, 8bit, no parits, one stop bit.

No matter what I have tried, DOWNLOADING from my telnetted accounts here, I invariably--I mean absolutely every time--get errors EVERY 4096 bytes--starting at byte 4096--with Z-Modem. My transfers have slowed to around 510cps as a result. My transfers TO Penn, however, have gone like lightning--102% efficiency, over 1200cps. V.42bis on both ends. Go figure.

I've changed every variable I could think of or someone could suggest, except logging onto another system--everything's either disconnected or busy. I've played with the flow control, tried logging in at 9600 baud, and used standard Kermit, Z-Modem, and X-Modem. Everything but Z-Modem gives me no errors at all, but at best a 535cps transfer rate.

I have used the U.S. Robotics template setting, AT&F1, which made no difference whatsoever. Where I come from, if you can reproduce an error every time, that means there's a bug in the woodwork somewhere. Both mail.sas and ccat.sas have given me this problem, and I've use rlogin, telnet, and the tn3270 protocols to reproduce it. I thought that perhaps it was the STe's serial port buffer--but every 4K incoming? And the error message reads "NAK received from remote host." Every 4k. At least I can transfer the big files in, but not out. Not at anything better than 10-20% of capacity.

HEEEEEEELLLLLLLLLPPPPPPP!!!!

Does anyone know how to go about building the joystick adapter for
dynabuster to allow up to six people to play ?
Or where I'd be able to find the information ?

Also, has _anyone_ managed to use gzip on a 1Meg STe ??

Cheers,
Dylan

There are no PD Speedo fonts. Also, there is no publicly available
(PD/freeware/shareware OR commercial) Speedo font editor or font
converter (not for the ST anyway -- I've HEARD there may be one
for IBM clones). Bitstream is the SOLE source of all currently
available Speedo fonts (even the ones that come with SpeedoGDOS,
Windows 6.x for DOS, and any available font packages are provided
by Bitstream). They normally sell EACH TYPEFACE for $39US each!!!

>How do I get the Falcon to actually accept a modem, I habe set up connect
>as required but the system still wont dial out.
Does the Falcon successfully talk to the modem at all? I bought a modem
on Saturday, plugged it in and it worked first time. All I had to do
was use the CPX to set the baud rate etc to match the modem defaults
(19200, 8 bit, 1 stop, no parity). The comms software defaulted to
pulse dialling (which works but is slow), so I fixed it up to use tone
dialling.

To get started, I used Uniterm v2.0, as that was the only terminal software
I had. It only works properly in ST High mode. But that got me
far enough to download CixComm, which works rather better, and Connect, which
I haven't tried out yet.

Why do you need it as an ACC? You only need to park heads on a) old drives that don't self park and b) when the machine is going to be moved. Even with b) if it's just moving about the room, you don't need to bother. Surely the park that comes with ICD stuff as a .prg would do?

In a somewhat similar setting as yours zmodem does not work for me
at all. This protocol is just too stupid to survive an abuse
from network relays, repeaters and terminal servers. It will work
great on clean direct connections.

In such circumstances I am using kermit, which works without problems.
The secret is that you need, on both ends, some modern kermit; something
like 5A(188) or 189 with windows and big block sizes. Windowing protocol
is less critical, but big blocks (and CRC) are. You have to set both
sides properly. Defaults are for extremely noisy connections via
switchboard which was just flooded. How far you can push parameters -
it is up to you to check. On most networks like yours 'set parity=space'
is a proper thing to do.

With 14400 connection (but faster modem<->computer link) I am getting
throughput in order of 1600-1800 cps. It very much depends to what
you are talking to, though. The other side may be a bottleneck.

Michal

P.S. It would be nice to have your e-mail address in a news header,
so 'reply' would work. If that is impossible, then at least in your
signature. rrice@netnews.upenn.edu does not work too well.

That's good; but it seems that hell might freeze over before Atari get around to releasing this update to Speedo. (You could replace 'Speedo' with 'TOS' or 'MultiTOS' in that sentence, of course...)

It *IS* released since january this year. You can get it from R.O.M. in
Berlin. This is the official version from Atari.

The problem is COMPO. They refuse to distribute the actual version.
Speedo 4.2 is much better than 4.0 and 4.1.
Nobody knows, why COMPO is ('nt) doing this.

I did pull Kermit C.159 off of Michigan and got around 400-500
this way. Probably again, because the errors I get are generated by
overflows (?) of my file transfer buffer, now set up to 50K from its
previous 4K.

You have to set both
: sides properly. Defaults are for extremely noisy connections via
: switchboard which was just flooded. How far you can push parameters -
: it is up to you to check. On most networks like yours 'set parity=space'
: is a proper thing to do.

Here I don't follow you. Network defaults are 7-bit, Even, which
you can change to 8-bit, None. Is there a flag I can set with sz?

: With 14400 connection (but faster modem<->computer link) I am getting
: throughput in order of 1600-1800 cps. It very much depends to what
: you are talking to, though. The other side may be a bottleneck.

Again, Penn seems to be sending faster than the STe can chew--I
guess. And I do save to a ramdisk...

A few PD Speedo's from an old PC CD-ROM were posted to some of the archives
a few weeks back. X-Windows comes with a few fonts - not exactly released
as PD, but donated anyway. They work - I'm using them with Speedo 4.2
(which, as have been said before, is readily available in Europe from R.O.M.
Software or serious dealers). Bitstream might be the sole *producer* of
Speedo fonts if that's what you mean by source. I believe Compo have a lot
of typefaces available which aren't stock items at regular Bitstream dealers.

Ah, yes... there is another problem. Some terminal programs do not take high speed port rates into account and do not create a large enough input buffer. If the program is too slow to handle that (and it almost always IS), then the input buffer in your computer will overrun and you'll have problems. Get a DA or tell your terminal program to change the input buffer size... at last 8k, I would say, although I always use a 20k buffer.

3274. Data in/out of DSP

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-15 02:36:16 UTC
From: zieg0008@gold.tc.umn.edu

3275. 3/486 emulators for the Falcon yet!?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-15 03:44:34 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <2tltf2$hoc@news.dmpe.CSIRO.AU>
Source record: 31966

Have the 486 emulators for the Falcon arrived yet!? I heard that Compo had finished the 486 version, but I cannot find any info yet. I have to get a PC soon, and rather would like to stick a card into my falcon instead of buying a dos box. I may have to buy a 386 ememulator for my ST if things keep going this way ....

Regards,

Karl.

3276. Second Post looking for Atari Magazines

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-15 03:53:28 UTC
From: root@uncc.edu
Message-ID: <2tltvo$2rf@ws223.uncc.edu>
Source record: 31956
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari.2600

Email address incorrect, correct one is: jonewby@unccsun.uncc.edu

Hello and thankyou for reading this post.

As stated in my previous and very long :(post I am desperately seeking
Atari magazine sources, Programming books, technical documents, etc.
anything to do with programming the Atari. I will accept information
concerning any Atari computer or video game system both new and old. I
plan to compile a listing (sort of a FAQ) and post it here for all to
see and will keep it up dated as long as I get new things to add to it.
Please email in the following (or any suitable) format:

For Magazines:
o Magazine Name
o Address (for subscription)
o Subscription rates
o Phone number
o type of Atari(s) covered (or type of programming covered,
i.e. M68k, C, Pascal,etc.)
For books:
o Title
o Author
o Publisher's Name (if available)
o ISBN
o Price (if available)

For Online-tutorials:
o Ftp address
o Directory
o Filename(s)

For telnet sites, gopher, www, etc:
o IP address
o Login:
o Pass:(if needed)
o Also instructions on how to find info,
subscribe etc. (if available)

Miscellaneous sources (Mailing Lists, Compuserve, Genie, etc.)
o Anything that isn't already covered
in AEO online for FAQs.
o For mailing lists
- Email Address & how to subscribe (if possible)

And anything else you feel is pertinent.
With ftp sites please send anything that is not covered in
the FAQ or clearly specified as having programming info.
Thankyou very much.
Email Submissions to: jonewby@unccsun.uncc.edu or jonewby@uncc.edu

John I use the Apple CD-300 with MetaDos 2.3 and have no problems at all in
processing multi-session Kodak Photo-CD's, the drive autodetects the
multi-session usage and works perfectly, sound like you have a faulty drive.

>it's just moving about the room, you don't need to bother. Surely the park that
>comes with ICD stuff as a .prg would do?

Now I have got you, you did not read my Brain waves, did you..???

I have seen this request many many times on GEnie in the ICD RTC..

If you have a Mega ST with a Built in Hard Drive, it runs all the Time,
so when you are using the disk drive to play games, etc, you hard drive
is running..

With the Help of Claus Brod, the Ship/Park command, you can use it to
park and unpark your hard drive, you need to turn on bit zero
in the 4th byte the block number byte, counting from zero,
this will cause the drive to unpark and spin up...

I have all ready tested this with the ICD SCSI command Util that I found
on GEnie..

I have been told that James the Butler can do this, but I think will end up
doing my own ACC or PRG, it only has to run on the Floppy..

I could just place a park program in the Auto folder of a Floppy...

Food for thought...

Any one interested in this project..??

For those that are into DMA devices, the ICD SCSI Util looks great, supports
internal SCSI...

>protected inputs anyways and it sounds like yours does).
>

No. According to 'Het complete Atari ST boek' (Dutch translation of 'Das
Atari Profi Buch') the voltage levels are:

Monochrome signal is 1 Vss over 75 Ohm thus 0 V is black and 1 V is white.
RGB signal is 1 Vss + 0.5 Vdc over 75 Ohm thus 0.5 V is lowest intensity
and 1.5 V is highest intensity.

Only the h-sync and v-sync signals are on TTL levels.

See you,

Robert Demming. (robertde@htsa.aha.nl)

Is the CD-300 the same as the so called Power-CD?

I bought this CD some weeks ago and almost everything runs fine using the mint-driver. But I haven't been able to install Metados 2.3 to use the CD under single-tos. Has anybody installed Metados 2.3 on a Falcon? (Together with a Power-CD from Apple.)

Is anywhere a (SW or PD) Programm available to play audio-cd's?

Hi, I am in the process of selling the 2.5" IDE drive that came with my Falcon to a PC owner. In order to correctly attach the drive to his system, we need some technical data on it.

Can someone please tell me what 'type' of drive it is? The PC CMOS set up requires a numerical type for the drive.

Also, can someone give me a description of the pins in the 44 pin cable?
Thanx,

Did you remove the terminators from the drive? You have to, even if it
sounds crazy.

You always will get the message "Not bootloaded" if you start AHDI from
floppy. AHDI will only bootload if it gets started automatically as
c:\shdriver.sys. Use HINSTALL to install AHDI permanently on the
drive.

Well using the original posting and a bit of general knowledge I managed
to get it working from both the interpreter and from a compiled program.
The posting which poked BASEPAGE only works from compiled programs I
think! ??

NOT ONLY. With a resolution-expansion (S-Blaster or BlowUP030) you can get
640*480 at 23kHz and a vert.freq. near 60Hz (dont remember exact value, data
for BlowUP030 Hard II)

3296. Atari Linux Compilations

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-15 13:18:49 UTC
From: mm68@unix.brighton.ac.uk
Message-ID: <1994Jun15.131849.14821@unix.brighton.ac.uk>
Source record: 31975

I have the sources for the Atari Falcon030 Linux port but I cannot for get them to compile. I have Gcc 2.5.8 and libs pl44 plus minix as stated that you need.

I changed the .mup files to something my tcsh could read and started the thing to make a linux image. After adjusting various little problems \ to / it came to building the image from the .o files made and I got reams of undefined procedure calls. I *was* using the corect gcc-ld and the only way to fix them all was to un-hash all the lines in the shell scripts which were hased out.

When I did this the thing ran through fine and I got the linux image. But when I tried to build the bootstrap I got another problem. A line in it indexed a field which did not exist! the line was something like base = p->page I think.

Anyone else have any luck with this...I am gonna mail the author once I get his address dug up but any help now would be great.

I have a Taxan Multisync which is supposedly compatible with a NEC Multisync,
although which model I don't know. It happily works with my Archimedes
machine, but resolutely refuses to work with my Atari STE :(.

So my answer to your question is "I don't know, but it could well be".

Has anyone succeeded in getting a Taxan multisync to sync to an STE?

My understanding is that to get a Multisync to work on an ST/STE/TT, it has
to be able to sync to the three rates required by low, med, and high res.
It appears that many Multisync monitors in PC land are really "several-syncs",
and can only sync to a handful of common values reliably (of which the
needed ST ones are absent). I believe there is a textfile on atari.archive
which describes how to build the proper Multisync box, and also has a list of
monitors that work. Hope that helps.

I don't see any reason why BASEPAGE peeking could only work with the compiled version. SHEL_ENVRN might work the same way internaly (I guess)..
But I may be wrong, it's such a long time since I did something in GFA-Basic.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The first C++ "compilers" were actually converter programmers that translated C++ code into obfuscated C code that would then be fed into a regular C compiler. I need such a beast for my Atari. I need something that will only do the translation but will not turn regular code compatible with my compiler into something incompatible.

I know there are such programs, because they were the first of their kind and I've seen people discussing them before. Where can I get one of these converters? Doesn't one of the Gnu programs do just what I'm asking for? I'd prefer C source to the converter so I can turn it into a resident program I can use with Lattice C.

Thanks.

Well, the subject about says it all... I've purchased a ground loop isolator and plugged it in between the out of the device and the in on the falcon, but I still get some hum when I try to sample.

Can anyone help me with this?

How'm I supposed to set this up- I tried to use the outs from the back of my CD player but the output was too loud for the falcon and I wound up getting distortion.. so then I tried using the headphone jack on a low volume setting with the ground loop isolator in between..

I hope I didn't damage anything, but how can I tell?

Source record: 31713

>What would be the best way to get data in and out of the DSP fast without
>wasting too much time on the 68030 and DSP side? To set it up as an
>interupt or try to do it in one lump transfer?

It depends on how much data you want to transfer, and which type of data.
If you don't have to transfer much data, you could use the Sound-DMA to transfer
the data. (max. 8x50kHzx16Bit) This won't take any 68030 time, you just
have to install an interrupt on the DSP.
The Problem is, if it's some critical data, you would have to program some
synchronisation and checks.

The other way is to transfer it via Host port. On the 68030 it's definitely
faster to send it in one big transfer instead of using interrupts.
The Interrupt overhead is quite big on the 68030.
On the DSP-Side you can use the fast interrupt routines, the overhead is very
small.

Thinking about it, I might have such a beast on my hard disk at home.
I never used it much, wrote it for a friend long time ago. It is an
ACC, parks all hard disks when called for the first time, unparks
them when called afterwards.

It doesn't solve your problem with communicating the status of the
drive to the hard disk driver, though.

In the june/july issue of the Dutch magazine 'ATARI ST Nieuws' on page 2
there is an advert from:

COMPO Software
Maastrichterlaan 1
6291 EK Vaals
The Netherlands

phone +31 4454 63888
fax +31 4454 66477

They say they have worked together with Atari to bring about version 5.0
of SpeedoGDOS. New is the possibility to use vectorfonts in Type I and
TrueType format. These formats are a standard on other platforms. There
are some new printer driver for printers such as HP 510 and Laserjet 4.
There is a new manual.

They offer a complete package with 22 fonts for fl. 149 ($ 1 = fl 2) or
an upgrade from 4.x with 8 new fonts for fl. 79. They also offer a
'Gold' and an 'Office' font package with each a 100 Speedo fonts from
Bistream for fl. 119 per package.

Thought you all would like to now.

Ed

>Anyone out there know of a good C compiler for my falcon?
Lattice C and GNU gcc are the main choices. I use the former. The latter seems to be a more advanced compiler, but is very resource-hungry.

>Do I need falcon specific compilers?
No. Lattice C will generate 68000 or 68030 code; this is controlled via a command line switch (or via the options dialog if using the GUI shell. GNU can generate 68030 code. There are a few versions about that do not support 68000.

Lattice C is available from HiSoft (Europe) or Oregon (North America). It comes with a batch of manuals that are shite. GNU gcc is free, but comes with no Atari-specific library (etc) manuals.

From: s002893@YPSERV.rz.fhtw-berlin.de
Message-ID: <2tp9g1$n1c@RW320B49.rz.fhtw-berlin.de>
Source record: 31894

RSVE is a small piece of hardware for MODEM1 (the only serial interface of ST, MegaST, STE) which needs only 4 wires for internal connection. It converts serial speeds: 110->38400, 134->57600, 150->115200.

I read here only randomly.

Greetings, HS

>of SpeedoGDOS. New is the possibility to use vectorfonts in Type I and
>TrueType format. These formats are a standard on other platforms. There
>are some new printer driver for printers such as HP 510 and Laserjet 4.
>There is a new manual.

IF they have added Type1 and TrueType support to Speedo I'm stunned! This is what we've been waiting for all along. It'll be both easier and cheaper to get fonts for the platform as Type1 and TrueType fonts are more readlily available and more exist as Freeware/Shareware. Lots of CD-ROM discs are available - the latest one being the Bitstream disc with all the fonts from the CorelDRAW bundle + a few more for $50 retail, even chaper on the streets. Whoa!

>They offer a complete package with 22 fonts for fl. 149 ($ 1 = fl 2) or
>an upgrade from 4.x with 8 new fonts for fl. 79. They also offer a
>'Gold' and an 'Office' font package with each a 100 Speedo fonts from

You will need a third party BOS driver that knows about Multisession drives.

Atari's BOS driver does not support Falcon SCSI (look into the README file).
You'll need a third party driver for that.

Wrong. I know for sure that CDARGEN has no multisession support, and the drive will *not* do that himself (how could it). I guess that you are using a different BOS driver.

From: dehall@iastate.edu
Message-ID: <dehall.771780966@vincent2.iastate.edu>
Source record: 31901

Hi all,

Recently I began thinking that it might be possible to get higher resolution video modes out of a ST by substituting the standard h-sync and v-sync with my own sync signals. Normally this wouldn't work, but I the overscan modification makes changes which I thought might make higher sync signals feasible.

Can anyone tell me if this idea has any merit?

Thanks,
Aaron Burghardt

>Can someone email me how to replace the TOS chip in a FALCON, not the
>actual removing of the chip, but what screws to take out the bottom of
>the case and what the chip has written on it, so I dont remove the wrong
>one.

Where is it?
* Remove seven screws in square holes on the bottom. One most certainly is
covered by the warranty label.
* Remove top cover.
* Remove screws from upper shielding.
* Unplug speaker while removing upper shielding.
* Remove RAM board.
* And there it is - in a square PLCC socket: The TOS ROM chip.

Cautions:
* Don't even think of removing the chip without the matching tool - the
socket is surface mounted and WILL BREAK APART very easily!
* When putting the RAM board back into place, make sure you got it in the
proper position.
* Don't forget to connect the speaker.

bye, Peter

Guessed wrong. The Seagate 157N has a "Parity Enable" jumper. If it's not
there, there's no parity checking.

We're talking Mega STE here, they never had these problems, since they all
are DMA No. C398739-001(A) equipped. Early 1040STE did have DMA problems.

I use freezedried terminal, and it works excellently as well as being really 'easy on the eyes'. It's on all of the local atari bbss around here as FZDZterm, or something like that, so I imagaine you will be able to find it where you are no prob. If not, let me know (jimh3@icebox.iceonline.com) and let me know how to send you a copy (I'm real new to the internet)

3332. How to connect a 17" color monitor for TT-HIGH

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-16 23:40:34 UTC
From: gert@ttgk.textlitho.nl
Message-ID: <Up-EFQXFCVE@ttgk.textlitho.nl>
Source record: 31906

I recently got hold of a 17" color monitor which can handle anything from 30 kHz upto ??? and I was wondering how to connect this beauty to the TT in mono mode. I now use a VGA monitor for the VGA resolutions and a Viking 21" mono beast for TT-High and they take up a lot of space...

Problem is that the output in TT-High is ECL logic and not the normal 75 ohm RGB output. Can I just connect the 'mono out -' to ground and the 'mono out +' to the input of a color channel ? according to the Atari Profibuch the monochrome output is a 'differential' driver but it doesn't mention what kind of load impendance it can handle.

The monitor is a 'Tulip 17" color display' with 5 BNC connectors on the back (R G B H V). With a Trident VGA card in a PC I pushed it as far as 1280x1024 non interlaced with 16 colors, so 1280x960 should work, the monitor adjusts automatically for any given resolution (tested 320x200 upto 1280x1024)

3333. C programming: calling the file selector

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-17 01:17:34 UTC
From: charles@eskimo.com
Message-ID: <Crloxn.DC9@eskimo.com>
Source record: 31935

Up until now I haven't utilized GEM in any of my C programming on the ST. I now want to call to file selector in a program. I'm using Heat and Serve 1.40 and using Gemfast. I'm calling the fselexinput function thusly:

```
rizz=fselexinput(char *path, char *file, &button, char *path);
```

When I compile I get a message from JAS saying there is an undefined symbol in myprog.o file someting like :_fselexi. In the past that has happened when the function hasn't been declared. I am #including the gemfast.h file in my source and I am including the aesfast.a library on the command line to cc.ttp.

Incidentally, looking at the gemfast.h file, there is no declaration of fselexinput() or fselminput, neither are they shown in the function quick reference in the gemfast.doc file. They are, however, in the body of the doc file, starting on page 45.
I'm using Tos 1.2.
What's wrong?

There are only 2 sets of scan/sync rates for ST low, medium,
and hi resolutions:

ST low & medium - 15.75kHz horizontal/50-60Hz vertical
ST high - 31.5kHz horizontal/72Hz vertical

I use EasyRider, a very good 68030/68881 Disassembler with GEM-Support.
EasyRider is mainly a Re-Assembler - you can diassemble all kinds of
programs, ROM, Cardriges and Bootsectors. EasyRiders allows to import
the symbol table of the programm, or you can assign your own labels.
Even tricky stuff like using an adress register as global pointer to
all bss data (megamax c did that) are handled by EasyRider.
The user interface and manuals (of the version i have) are in german.
EasyRider costs about 250 DM (i think), the autor is Andreas Borchert.

An older Disassembler i know of is Detective, you could not change the
labels. I dont think that Detective is still sold (it was from an
UK company).

You can also disasselbe with TempleMon or PeaceBug, but you dont
get label information - but global symbols are supported with
the SYMBOL driver from Robert Federle. TempleMon (2.02) and
PeaceBug (1.21) are ShareWare, you should find them on some
FTP servers.

Greetings, Karsten

Hard & Soft has a little box which makes it possible to get the TT mono mode on multisyncs. Your monitor need to support a certain frequency, though. I don't have this info handy, but I believe their address should be easy to find.

You get them for free if you install the Let 'em Fly package in your
/AUTO. Otherwise, you must use PROG_DEFs. It isn't too hard, honest!

3340. Mintnet/ MinixFS problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-17 07:55:42 UTC
From: huveneer@math.ruu.nl
Message-ID: <1994Jun17.075542.9537@cc.ruu.nl>
Source record: 31913

I have a problem installing the net-042 package.
My configuration when I started yesterday evening was:

Mega STe, mint 1.10 (unpatched), minixFS 0.60 pl 10 (binary distrib. from a.a.u.e.)

I have not experienced any problem with this configuration.

Ok, so I wanted to install net-042.
I read I had to patch mint 1.10 in order for the socket driver to work.
So I patched mint, recompiled and installed it. No problem.
The socket device driver started up nicely. Guess this means I patched mint right.

My problem is that my Atari hangs after some disk accessing.
If I recall right, patching mint was needed to prevent such behaviour.
Before patching mint, minixFS 06 pl 10 worked fine, and after patching it hangs!

The only sensible explanation I can think of, is that the binary distribution of
minixFS 0.6 pl 10 on a.a.u.e assumes mint is NOT patched.

Is this true?
Any help is really appreciated here.
Thanks.

Richard.

Try putting a string field underneath the letter you want to use, i.e. create a string with the _ character and place it over the letter. Voila.

3345. MinixFS 0.60/Mint 1.10 problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-17 17:05:58 UTC
From: dclemans@sherlock
Message-ID: <2tsl5m$2so@hpcan240.mentorg.com>
Source record: 31921

Last night I tried to do some work in a MinixFS 0.60 filesystem, running
under Mint 1.10. (Consisting of deleting a large number of files, creating
a large number of other files (by unpacking a number of tar files),
and modifying others). Following that I tried some compilations.

Then I rebooted the system (a 4mb TT) this morning. After the reboot it
looks like the old directory structure of the filesystem reappeared,
which meant that the data in the filesystem was royally screwed up.
(A multi-megabyte directory tree that I had deleted was back, and
a number of new directory trees that I had created were gone, etc.)

Does anybody have any idea what happened?

Thanks,
dgc

> Is there such a product? Is it even possible?!

Not directly but with a little harwdware extras it can be done. You'll
need :-

ftp.tu-clausthal.de:/pub/Atari/Telecom/tcpip/tuw-tcp.*

This archive shows the schematic for a cartridge-port to pocket ethernet
adapter (as used on the PC's). The software and drivers are there for
the REIBL (German Ethernet card) and the D-Link DE-600 pocket ethernet
card.

I can't vouch for the compatibility with the TT but I don't think it
should be a problem to adapt it.

It's well worth looking, since there PC parallel port, pocket ethernet
cards are very cheap (by comparison) and it makes the whole thing VERY
attractive indeed (I'm heading this way too).

Cheers, Martin.

The problem is CDARGEN.BOS that comes with the Atari Metados package. HS-CDROM.BOS, included in the CD-Tools package (payware, distributed by Hard & Soft), does support multisession drives.

CDARGEN.BOS is a nasty peace of software anyway. It used to crash regularly on my TT with a Toshiba XM-4101.

3348. ST MMU's and 256x4 bit Memories

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-18 00:48:44 UTC
From: martin@gw6hva.demon.co.uk
Message-ID: <771900524snz@gw6hva.demon.co.uk>
Source record: 31925

Hi ...

I'm looking at putting a 4Mb ram card into my old Mega-1 (2.5 at the moment).

This machine was a non-standard in terms of memory as they used 514256's instead of the 514000's in the Mega 2 and 4. In this configuration, the memory is addressed in both banks, with RAS0/CAS0/L/H dealing with 512Kb in bank 0 and RAS1/CAS0/L/H in bank 1.

This means that I have to derive some additional select lines to further map in the additional 3 512Kb blocks of memory per bank, to take it up to the full 4Mb.

Now before I go re-inventing the wheel, has anyone already done this, or is there a doc or something that I can ftp somewhere. It's not a difficult job but it is tedious, especially if it has already been done before.

Alternately, if you have a schematic for a machine that has 4Mb using 514256's, I'd like a copy of it (costs re-imbursed). I don't need the whole thing, just the segment detailing the MMU and and additional address decoding logic that's being used to the 256x4 ram's.

Cheers for now, Martin.

No, the drive itself is multi-session, and will work even with Extendos which
does not have a multi-session driver. The CD-300 automatically reads the
later FAT tables on the CD and adjusts accordingly.

>
>Can anyone tell me if this idea has any merit?

Hm. The overscan mod keeps the display enable signal active for a longer time, allowing you to draw more pixels on the screen using the normal sync rates. I would think that even though you increased the sync rates, you couldn't get significantly higher resolutions than overscanning allows, because the video hardware is still DMAing pixel data at the same old rate. To get higher resolutions you would need to increase both the h-sync rate and the pixel clock.

The above is not a definite answer, just my conclusion from 2 minutes thought...

3354. Very cheap TT hi-res monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-18 16:30:08 UTC
From: sbparker@harold.ukmail.NET
Message-ID: <Up-EFSRBAVC@harold.ukmail.NET>
Source record: 31934

Just to reiterate a posting made by Dennis Armstrong (dba@jet.uk) a couple of weeks ago, anyone interested in a dirt cheap TT high-resolution monochrome monitor could do far worse than get hold of a Princeton LM-301 from

Bull Electrical
250 Portland Road,
HOVE
BN3 5QT
UK

Tel. (0273) 203500

The total price was a little over 32 UK pounds(!), including delivery. I got mine a few days ago and am very pleased with the result. The monitor is capable of around 1600x1200 but with a few internal tweaks, the 1280x960 TT-high image can be stretched to fill nearly the whole screen.

The only warning I'd give is that, since the screen is 35cm (14 inches) corner to corner, you need to have pretty good eyesight (or a nice set of fonts a la SpeedGDOS).

This also gives me a chance to thank the guys at System Solutions/Atari Workshop in Windsor for taking the trouble to sort out a cable for me (I'm a walking disaster area when let loose with a soldering iron). I'm certain the cabling info Dennis posted helped a great deal.

If you do decide to get this monitor, make sure you stress that you want an LM-301. First time round, they sent me an LM-300 (sort of mini A4 aspect ratio) by mistake :-(

From: cgc193@ecs.soton.ac.uk
Message-ID: <2tv8j4$hla@gauguin.ecs.soton.ac.uk>
Source record: 31933

Hi all,
This is the first time I've ever posted anything, so I hope I'm doing this right (please excuse me if I'm not).

I am currently in need of a sourcecode (ASSEMBLY) which loads and displays IFF pictures and animations saved with "VERT WORD" compression (which is specific to the ST). If anyone knows where I can get one, please tell me.
Also, I would like to know if anybody knows of an extremely fast tracker sourcecode that plays MODS on the ST, and leaves some processor time free. I heard that TCB tracker MODS only take 30 percent processor time to play on a standard ST (not STE). Is this true?. If so, could I convert normal AMIGA MODS to play through this routine?

I have AUDIO SCULPTURE, which is a tracker program that also loads TCB tracker MODS, and I used it to save a TCB MOD to AMIGA MOD format. However, when I tried to play this through one of the plethora of AMIGA MOD players (Noisetracker), the speed was all wrong. This led me to conclude that TCB tracker uses its own timing routines. If there is a converter between the two MOD formats, would it take care of this timing difference?

I have also noticed that the OVERLANDERS (demo group) use their own module playing routine in all their demos, that leaves enough processor time for them to shift around huge sprites, etc ... Is this routine available anywhere, and would I be able to play normal AMIGA MODS through it?.

Finally, does anybody have the precise file format of normal AMIGA MODS?

If you know the answers to any of my questions, don't hesitate to reply, I await any replies eagerly.

3356. C programming: calling the file selector, again

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-18 18:35:09 UTC
From: charles@eskimo.com
Message-ID: <CrLtt6.6Ar@eskimo.com>
Source record: 31855

Up until now I haven't utilized GEM in any of my C programming on the ST. I now want to call to file selector in a program. I'm using Heat and Serve 1.40 and using Gemfast. I'm calling the fselexinput function thusly:

```
rizz=fselexinput(char *path, char *file, &button, char *path);
```

When I compile I get a message from JAS saying there is an undefined symbol in myprog.o file someting like: _fselexi. In the past that has happened when the function hasn't been declared. I am #including the gemfast.h file in my source and I am including the aesfast.a library on the command line to cc.ttp.

Incidentally, looking at the gemfast.h file, there is no declaration of fselexinput() or fselminput, neither are they shown in the function quick reference in the gemfast.doc file. They are, however, in the body of the doc file, starting on page 45.

I'm using Tos 1.2.

What's wrong?

[WA>email of author?

Warwick, there is a 'better' font selector availably that is compatible with
UFSL. It is by Holger Weets, and the filename is FONTSEL.PRG (the name of
the archive should be nearly the same). It allows you to set the size
of the font manually, if I recall correctly, and it is MUCH smaller than
the UFSL. In fact, it ALSO looked easier to implement... :) You will
have to use archie to find it, though, as I do not recall exactly where
I got it. Try ftp.cs.tu-berlin.de (maybe) or ftp.tu-clausthal.de (not
quite as likely).

Is this the full disk one where the 3D doll spins (and is really really old)?
I dimly remember seeing such a thing (I think it was color only , but the
animation was in greyscale). I'll have a look around and see if I can find
what I am talking about.

The main problem with FzDsTerm is it has alot of bugs and is also a
memory hog. :(

Also, Arron Hopkins jipped alot of people who registered... :(

Personally, I find this to be one of the most grotesque "features" of
the MS Windows and OS/2 graphical interfaces... I suppose it's nice for
someone that for some reason or another can't use a mouse (or for those
people just stupid enough to use a GUI without a pointer), but it makes
the interface cluttered and ugly.

IMHO it should be something that can be turned on or off globally like
the Mac's EasyAccess INIT does (it also makes things easier for people
that can't use mice; there's no-one stupid enough to use a Mac without a
mouse, since they're shipped with them, unlike some PCs).

3367. SIMMS on an STE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-19 19:40:15 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994Jun19.194015.673@bradford.ac.uk>
Source record: 31841

Ok, I'm seriously thinking of upgrading the memory in my 1040STE to
something like a 4mb model.
Just a few questions before I take the plunge as it were ;).
I'd appreciate any help on these.

1) I've heard that ST's can use PC simms since they just ignore the 9th bit
on the simm, is this right?

2) What is the max/min speed of the Simms needed to work in an ST?
If the speed of the simm is greater than the speed the ST can access
it, will they still work?

3) Will ST simms work in a Macintosh, and vice versa?
(a macintosh plus to be more precise; they have 30 pin simm sockets in
them)

4) Are there any problems with the power supply and having 4 megs installed?
I've heard someone say that they had problems when they'd put 4 1 meg
simms in and his power supply just gave up the ghost on him.....can anyone
disprove/confirm this?

That's about it I think ;).

Thanks in advance for any help,

Paul.

>1) I've heard that ST's can use PC simms since they just ignore the 9th bit
> on the simm, is this right?

Yes, you can use either 8 or 9 bit SIMMS.

>2) What is the max/min speed of the Simms needed to work in an ST?
> If the speed of the simm is greater than the speed the ST can access
> it, will they still work?

The ST accesses memory at 150ns under 2meg, and at 120ns for 2 or four
meg (don't ask me why!). Use SIMMS faster than 120ns - if you use (say)
50ns SIMMS the ST still accesses them at 120ns, so anything under 120ns
is fine.

>3) Will ST simms work in a Macintosh, and vice versa?
> (a macintosh plus to be more precise; they have 30 pin simm sockets in
> them)

Not sure - if they are standard SIMMS then yes.

>4) Are there any problems with the power supply and having 4 megs installed?
> I've heard someone say that they had problems when they'd put 4 1 meg
> simms in and his power supply just gave up the ghost on him.....can anyone
> disprove/confirm this?

The power requirements are pretty small, the power supply should be able
to cope without problems. (my power supply died when I had two meg in -
nothing to do with the amount of memory, the ST power supplies are hardly
the most reliable components of the computing world... :-))

3371. UFSL - poor under MultiTOS.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-20 01:38:46 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2u2rv6$1j5@uqcspe.cs.uq.oz.au>
Source record: 31847

I tried out the Universal Font SeLector recently uploaded, but found that
it was abysmally slow under MultiTOS - clicks on the font names were very
slow, and I had to hold the button down for 1/4 second or so to get it
to respond.

As for the look of UFSL - YUCK! All that white-space! And there is no way
to type in a point size for Speedo fonts and have it update the preview area.

How many programs use this? Of course, the TSR could always be fixed and
any program using it would benefit immediately.

Try making that fsel_exinput() instead of fselexinput()

Note the underscore, if you use other GEM AES stuff you might also need to link in vdifast.a as well sometimes, IIRC I had to once when I didn't think I needed to, perhaps some of Ian's GemFast routines use the VDI.

> Incidentally, looking at the gemfast.h file, there is no declaration

> in the body of the doc file, starting on page 45.

You're right I don't think they're defined in the GEMFAST.H anywhere, probably because HSC's function checking (for want of a better term) doesn't check on their existance, but the compiler will still find them.

I figured out what happened; I got hit by the bug in one of the timeout
patches for Mint 1.10, which caused Mint to not update directories on disk.
The bug is mentioned in the readme files that go with MintNet net-042.

dgc

Dave Clemans (dclemans@sherlock) wrote:

There is nothing special about the Mega ST1 Memory, its just the same as the Mega ST2/4, it just uses 4 bit wide RAMS, instead of 1 bit ones...

Just remove the Rams and replace with 4*1 meg SIMMS, its that simple, that is if you are into soldering and the such like....

The functions are called fsel_exinput and fsel_input (mind the underscore!).
Then it should work.

No, there's not even a software 8086 or 80286 emulator for
the Falcon. For the Falcon030, there's only the Falcon Speed
286 board and should soon be a 486 version.

Message-ID: <1994Jun20.164328.654@isle.waterloo-rdp.on.ca>
Source record: 31871

I wonder if anyone has seen this before...

I just picked up a Mega STe, in questionable condition (no power supply, no ram, no rom) I moved the roms from my TEC board to it, and plugged in two simms, and wired up a power supply (only +5v, and +12v at the moment) Everything works happily, except hooking up a hard drive to the DMA/ACSI port on the back.. Won't talk at all! Is there some jumper or something to tell it to use the external port (there is no internal host adapter) or does it need -5v/-12v to operate? (Can't see this one) Or is the DMA broken in some way... Floppy works fine...

E-mail to drichard@isle.waterloo-rdp.on.ca, or just post here, I read fairly often... Thanx a lot!!

Thank you, thank you, Alan, Thomas and Paul. It now compiles ok but
bombs out. (3 bombs.) Here it is, in all it's glory:

#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <gemfast.h>

int main()
{
static char path[128], file[128], prompt[128];
static int exitbutton, rizz;

strcpy(path, "A:\\*.*");
strcpy(file, "filename.ext");
strcpy(prompt, "What is reality?");
printf("path=%s\nfile=%s\nprompt=%s\n",path,file,prompt);
rizz=fsel_exinput(path, file, &exitbutton, prompt);
printf("You have selected the %s file\n", file);

return 0;
}

Anyone know why?

And why wasn't the underscore in the docs? Is that a GEM convention
that I need to be aware of? I can see that this would be easier with a
good GEM referenece.

And incidentally, sorry about the repeat message. It hadn't propogated
in two days and my local provider was being upgraded so I figured it
didn't make it out.

I have a problem with disks and I know I have seen some response related to this
so here goes:

I have a 1040ST at home and a 486 at the office. The computer at the office
has a much faster modem, so I download the ST programs from the Unix computer
I link up to. I then unarchive (ZIP, LZH, ZOO, ARC, etc.) the programs and
copy them onto an IBM formatted disk. I am starting to have problems with a
few of my disks. Suddenly, *every* time the disk has to be accessed, the
machine gives me a warning "Disk retry fail - If it is a hard drive, check
connections. Floppy, then insert disk, etc." If I take out the disk and then
put it back, making sure I get a definite click on the internal ST drive,
then the machine is able to read the disk....until the next time the disk
is accessed.

Questions:

1. I am using 3M preformatted disks. I am pretty sure I formatted them on
the IBM anyway, but not positive. Is this having an effect ? I have heard
that preformatted disks have serial #s of 0, is this a problem?

I used Norton Disk editor at work and I compared an MSDOS formatted disk
to a disk I formatted with ps2form (from Diskutils in atari.archive). Here
are the differences:

PS2FORM (on ST) MSDOS 5.0 (on IBM)

OEM ID IBM.. MSDOS5.0
Extended Boot Record
Signature 00 Hex 29 Hex
Serial # 0 173938138
LABEL .....1.... NO NAME
System ID (weird chars) FAT 12

These are the differences between the two Boot Records. Should I change
the Serial # to a large number? Does the ST have problems with seeing
two disks with the same serial # in sequence ? How does this cause my problem?

Eventually, the drive can no longer access the disks. Should I get unformatted
disks ? Is ps2form a good program to format disks for the ST and IBM ? Or,
should I just format them at the office?

Help!!!

3388. Sozobon C 2.0 problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-20 17:06:12 UTC
From: raz@MCS.COM
Message-ID: <2u4ia4$bre@Venus.mcs.com>
Source record: 31866

I just downloaded Sozobon C 2.0 and I have a few problems with it.

I wrote a simple Hello, World! type program and when I ran it under gulam, I typed "cc hello.c" and I got an error: "Couldn't find hcc.ttp" This is even though *all* the files were on a floppy w/o folders, *and* I changed the LIB, PATH, TEMP, TMP, INCLUDE environmental variables from gulam.

Can someone tell me what I am doing wrong ? Additionally, I would like to know how someone runs this program on a 1040ST with just the internal floppy? Do you use a ramdrive with an autocopy to copy the files to the ramdrive ? What files do you copy to the ramdrive? What is your directory structure and what do your command lines look like?

Thanks for any help you can give.

Hmm.. I'm sure someone will correct me if I am wrong, but isn't it the
case that fsel_exinput is only implemented in TOS versions 1.6 and
above? (or maybe 1.4 and above..) - In your previous message I think
you mentioned you were using TOS 1.2.

Fsel_input should work though..

Keith.

> drive market (prefer Seagate)?

I have an 85M Seagate and it drives me up the wall. It's noisy, and
it's unreliable (just could be my system; it worked fine at SCSI ID 0,
but acts flakey at any other ID).

I like Maxtor and Conner drives... they're fast, they're fairly quiet,
and they're reliable.

A lot of people also like Quantum drives... I think they're noisy
though, especially when seeking. I've got two (got 'em for $60 each,
not bad for 52M disks) and I've never had any problems with them.

My other disk (yes, I have four attached to my ST) is a Rodime; fast,
quiet, never a problem... naturally, the company went out of business a
few years ago... ;-)

>
> 1) I've heard that ST's can use PC simms since they just ignore the 9th bit
> on the simm, is this right?

I am currently using a mixture of 1X8 and 1X9 SIMMs in my MegaSTE, so I
believe this is correct.

> 2) What is the max/min speed of the Simms needed to work in an ST?
> If the speed of the simm is greater than the speed the ST can access
> it, will they still work?

I think 150ns is as slow as you can go. 120's will definitely work. I don't
think it matters if the memory is much faster (in fact, some of my memory
is quite fast, and it works perfectly).

> 3) Will ST simms work in a Macintosh, and vice versa?
> (a macintosh plus to be more precise; they have 30 pin simm sockets in
> them)

It depends on what SIMMs you have in the ST(E). However, the reverse is
true (Mac Plus memory works in ST(E)s), if that answers your question.

> 4) Are there any problems with the power supply and having 4 megs installed?
> I've heard someone say that they had problems when they'd put 4 1 meg
> simms in and his power supply just gave up the ghost on him.....can anyone
> disprove/confirm this?

I have heard of problems like this, but they usually relate to the installation
of a 3rd party memory board.

Oh, some STEs require SIPPs, not SIMMs. There are SIMM->SIPP adaptors
available, though they might end up making the SIMMs sit up too high. Hope
that helps.

Not exactly; the fsel_exinput() function of GEMFAST does not emulate
the new file selector. The function that does that is the full-blown
one (the name is escaping me at the moment) - fsl_dialog()? It is
something along those lines.

: }
```

: Anyone know why?

As a more or less educated guess, the problem may be that you don't call appl_init() before calling fsel_exinput(). It is necessary that you make your application known to the AES before you can use the AES routines (other than appl_init(), of course).

: And why wasn't the underscore in the docs? Is that a GEM convention
: that I need to be aware of? I can see that this would be easier with a
: good GEM referenece.

No, there's no convention whatsowver that requires you to add any underscores to function names by guessing. It's a typo in the docs that you have. A good GEM reference is certainly a very handy thing to have when it comes to GEM hacking :-) . Other than that, remember that you can always check the header files (gemfast.h in this case) if you're uncertain about the exact name of a function.

Until I got my CD-ROM drive today, I'd rather ignored any discussions about the devices. But now I have a question or two, if anyone could find the time or inclination to asnwer them...

Bearing in mind I've got an Apple CD300 plugged into my TT's SCSI port...

1) Is the MiNT XFS driver freely available (I'm running Extendos at present, but it isn't entirely MultiTOS friendly)

2) Is there a player for audio disks? (I'm sure the asnwer must be yes, but I can't recall any details)

Lacking FTP access, I can't easily go delving into other machines. So if possible, please suggest mail-servers that might have appropriate files.

Thanks

Steve

> Lots' of stuff about pre-formatted MS-DOS disks...

Yes!! Pre-formatted MS-DOS disks on an Atari ST will cause problems
because of the serial numbers that seem to be the same. I bought a pack of pre
formatted MS-DOS disks once (because they only had those and they cost the same
as the usual un-fomratted disks), and checked the serial numbers- which were all
the same!
There are utility programs that change the serial numbers of disks without erasing any
data on them.
Look up in the usual FTP sites and look under "utilities" or "disk" or something.
I **think** one of them is called "Uneekit" or something.

>
Various people suggested to add an underscore, as in:
fsel_exinput()
That will probably cure the linker problem. However there is still another
problem:
>
> I'm using Tos 1.2.
>

As far as I remember, fsel_exinput was introduced in Tos 1.4.
So you have to check the Tos version (AES version actually) to see if
fsel_exinput is available:

/* This is compiler-dependent; here, _global is the global array of the
AES parameter block. */
#define GEM_VERSION (_global[0])

#define FSEL_EXINPUT_AVAILABLE (GEM_VERSION >= 0x130)

char *
FileSelector(prompt, buf)
const char *prompt;
char *buf;
{
char base_name[FILESIZE];
/* initialize base_name...*/

if (FSEL_EXINPUT_AVAILABLE) {
fsel_exinput(buf, base_name, &valid, header);
}
else {
fsel_input(buf, base_name, &valid);
}
/* Build complete filename from buf and base_name in buf... */
return buf;
}

Hope this helps...
```

3402. Is GEM a ball and chain?? (Why is my code so slow?)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-21 05:03:04 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <2u5sa8$d8k@geraldo.cc.utexas.edu>
Source record: 31879

Hi,

Is it possible that a given piece of C code runs dramatically slower under GEM than in a regular ttp program. I tested a piece of code in a small ttp program and it performed adequately. When I put that same code (with no changes!) into a larger GEM program, performance took a nose-dive.

The code that seems to be causing the problem just copies sections of one file to another (one character at a time), using fgetc and fputc.

```
while (count--) {
ch = fgetc(InFile);
fputc(ch, OutFile);
}
```

It now appears to take 5-10 times longer than it took in the plain ttp program. I had planned to change this code to use fread/fwrite at a later date, but I am baffled by this performance hit. Can anyone explain this??

Thanks,

-Tim Gallivan

This is bollocks. For many people, in many situations, it is easier to
use the keyboard than the mouse. For instance, if I want to minimise
the window I am typing into now, I could either take my eyes off of the screen
and my hands off of the keyboard to locate the mouse, then find the minimise
icon and press it, then move my hands back to the keyboard to continue
working. Or, I could just hit ALT-F9.

I definitely appreciate being able to use both the keyboard and mouse.

I want to redirect the printer output into a file.
Can anybody tell me how to do this on a Atari 1040 ST ??

Thank you!

Christian Slump

Take a look at Gemdos functions 69 and 70, Fdup() and Fforce(). They should
solve the problem.
Something along the lines of:

```
int file;
file = Fopen(...); /* check return value */
Fforce(3, file);
```

Of the top of my head...

>I have not experienced any problem with this configuration.

>Ok, so I wanted to install net-042.
>I read I had to patch mint 1.10 in order for the socket driver to work.
>So I patched mint, recompiled and installed it. No problem.
>The socket device driver started up nicely. Guess this means I patched mint right.

>My problem is that my Atari hangs after some disk accessing.
>If I recall right, patching mint was needed to prevent such behaviour.
>Before patching mint, minixFS 06 pl 10 worked fine, and after patching it hangs!

What does 'hang' mean, system crash or reboot needed?

Note that the unpatched Mint 1.10 is full of bugs. Best get

ftp.inf.tu-dresden.de:/pub/atari/Mint/Kernel/mint-1.10-1.10h3-diffs.gz

These is a unified MegaPatch against clean Mint 1.10. This includes the
patches needed for Mint-Net to work and fixes some ugly bugs. Try this
and tell me whether or not this cured the problem.

Kay.

>The bug is mentioned in the readme files that go with MintNet net-042.

If you have patched your Mint 1.10 using the patches that came with
MintNet versions < 0.42 you SHOULD REALLY get MintNet 0.42 and re-
compile Mint using the patches in the net-042.tgz archive.

There is a very, very bad bug in older patches (from 0.30 or 0.40 or 0.41).

That was it. Thanks much! I appreciate the time that you and the
others have taken to answer what for you are such elementary questions.

Several people mentioned that fsex_exinput isn't supported in Tos
1.2. That's right, but Gemfast's lib includes emulation for earlier
version's of Tos.

3414. CD ROM Extendos / MultiTOS clarification

Newsgroup: comp.sys.atari.st.tech

From: sbparker@harold.ukmail.NET
Message-ID: <Up-EFVTCAUX@harold.ukmail.NET>
Source record: 31742

Just in case my earlier post didn't get past my news software, here's a clarification of what I said yesterday, when I hinted that Extendos was not entirely MultiTOS compatible:

I found that if I moved Extendos in my AUTO folder so that it was executed *before* MiNT, everything worked flawlessly.

Sorry for the confusion (and possibly the double post).

3417. handling CICONS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-21 20:36:32 UTC
From: jbeeghly@u.washington.edu
Message-ID: <2u7j0g$5fa@news.u.washington.edu>
Source record: 31743

OK, I'm kind of diving in deep here..... I'm been programming GEM in C
for uite a white now, and I've done some mwork with BITBLK structures,
but I'm having some trouble with CICON's and would appreciate the help.

I have created a 16-color icon (via Interface) and I'm trying to access
the image's data from within my program.

I have typed in the CICON and the CICONBLK structures (as defined in the
compendium on p.6.21). If I undertand the compendium correctly, then
each CICONBLK contains 8 different icons...

```
colors
-------------------------
mono SELECTED mono UNSELECTED
4 SELECTED 4 UN
16 SELECTED 16 UN
256 SELECTED 256 UN
```

and if I understand the compendium correctly, to access the different
images, you need to cycle through the CICON link list.

In my program, I have the following:

```
OBJECT *form;
CICON *point;

rsrc_gaddr(0, FORMID, &form);

.
.
.
.
point = ((CICONBLK *)form[IMAGENUM].ob_spec)->mainlist;

if(point->next_res != NULL) /* If there is another image */
{
point = point->next_res;
}
else
{
v_gtext(handle, 100, 100, "No can do ");
}
```

well, when I run my program, the "no can do" string is outputed. I
figure either
1) I'm doing something wrong here.
2) Only the 16 color icon is in my structure.

The reason why I think there are other images, is that I looked at the pixel data for the image, and it isn't what I expected.

I'd appreciate any help anyone could give me......

Jeff

> should I just format them at the office?

I have used disks formatted with ps2form on all kinds of different machines,
and they have never failed me. I'm not sure if it does a random serial
number, but my guess is that it does (as I have not had problems, even
when using a bunch of ps2form disks sequentially on PC, ST, Mac, Sun, etc.).
So, my suggestion would be to format a bunch of disks with ps2form and
use them for your file transfers. I have a batch of disks for which I
foolishly used permanent labels (which are now totally inaccurate), so they
now have MSDOS written on them in big red letters, and are my "transfer"
disks :-). I formatted them with ps2form, and have been using them for a
long time now.

Thanks to Jan, Ben & John for answering my question.

One of the problems I am having with a particular program is that it launches in med rez, and at various points in the prog. I switch it to low rez for graphic reasons.
Apart from the fact that I have to fence the mouse in once it switches it works just great - that is, when I use Warp 9. When I run it without W9 all the colors above color 4 go white, rather than accepting the setcolor commands.
I am wondering what Warp 9 does that allows the full 16 color low rez pallette and if I can incorporate that into my program. Or if there is a better rez change procedure I can use that lets me use all the colors and maybe even adjusts the screen size to the proper 320 pixels and back.

Hi,

I am sorry I posted yesterday an article to this newgroup but it was allready
empty (some error occured during the posting at my side...).

I want to write a program which calls automatically a routine when
the receiving buffer of the serial interface is full. I thought this
problem could be solved with an interrupt.

I found a BIOS or XBIOS routine which could do the main job of this
problem, but until now I was not successful.

I want to use the programming language C.

Any help or pointer etc. would be very appreciated.

Gerald

It isn't slow under single tasking TOS. Maybe it is a conflict with a
mouse accelerator. I had such problems once too.

>As for the look of UFSL - YUCK! All that white-space! And there is no way
>to type in a point size for Speedo fonts and have it update the preview area.

I like the look. It is very clean. But of course you can always write a
better font selector and sell it. I especially would like one that knows
about font families (or can be told about font families). The interface
is defined so go for it. If you can do better I'd love to see it.

>How many programs use this? Of course, the TSR could always be fixed and
>any program using it would benefit immediately.

I only have ST-Guide which uses it. I'd expect that more programs will
follow now the UFSL has been uploaded to ftp-sites (I ouploaded it to
atari.archive and ftp.cs.ruu.nl)

>email of author?

It was in the docs, but I think you need to add @...maus.de to the end.

This thread reminds me of a humorous incident dating back to my old 8-bit days (ah... now those were the days!):

I've always purchased and used generic diskettes, both 5.25 and 3.5, finding that I could obtain huge cost savings by buying them in bulk (my favorite source being MEI Micro). After just receiving a large shipment for distribution to my Atari user group, I was in the process of formatting a bunch of them for that month's PD disk-o-the-month. A rather snooty member was giving me a hard time for buying those 'junk' diskettes, saying that the extra money for quality disks was well worth it, even claiming they were faster (yeh, we know that's a load of crock but you had to know this guy). Anyway, to prove his point, he opened up a brand new box of Maxell Gold Label 5.25 disks which at that time were probably the most expensive available, about $2.00 each or so, as I recall. Anyway, out of the box of 10, 4 of them would NOT format at all.

heeheeheeheehee... did I ever enjoy _that_ one! :)

Matt, if it helps any, I have the same questions. After finally
getting the distribution kit to work, I was able to go the tcsh.ttp
shell and do a few 'unix things'. I managed to get mint110s compiled
last night (you have to run make -f and use an explicit pathname or
else make is so braindead it doesn't know to use the makefile in the
path you are presently in. Now I'm trying to find some better
documentation on minix because I don't know which executes first, rc
or profile. Whne I log in, I have to source profile to get my paths
and environmental variables to work. It would be nice to see someone
elses setup and just copy that until I can learn up from down in this
environment. Good luck,

Michael

Sounds familier. A friend used to buy Verbatim 5.25 inch disks at 25GBP a box of 10 - this was in 1982 - a lot of cash. I used to buy unbranded ones at 0.5GBP each. He was really amazed to hear I rarely got a bad disk - maybe 1 in 50. He assumed 1-2 out of a box of 10 would be bad - that was his success rate with pricey disks.

3432. GFA Basic question (another one)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-22 15:54:16 UTC
From: ceebsm@cscd4c3.caledonia.hw.ac.uk
Message-ID: <Crt2uH.M80@cee.hw.ac.uk>
Source record: 31760

Ok guys/gals!

After the excellent responce to my last mail I am hoping someone
can MAIL me an answer to the next!

I want to know how to redirect output to the screen to a text file. I
need to be able to run the GFA Basic Compiler and have all output go
to a file so that my menus/dialogues are not messed up!

I think I should use fforce() [GEMDOS 70] but so far I've been unable
to get the correct handle for the screen. Can anyone let me know how
this is done?

Any information - especially BEFORE Friday 23rd June (when I stop
uni for the summer) would be greatly appreciated!!!

Barry

Source record: 31761

Jim Harrington (jimh3@icebox.iceonline.com) wrote:

: One of the problems I am having with a particular program is that it
: launches in med rez, and at various points in the prog. I switch it to low rez
: for graphic reasons.

You don't say how you switch resolutions, but AFAIK it can be done
only by using XBIOS(5,L:-1, L:-1,W:0) or by accessing the hardware
directly. With both these methods, the VDI is aware of the switch.

: Apart from the fact that I have to fence the mouse in once it switches
: it works just great - that is, when I use Warp 9. When I run it without W9
: all the colors above color 4 go white, rather than accepting the setcolor
: commands.

After changing resolutions without the VDI knowing about it, you
use VDI routines to draw graphics on the screen. Assuming the screen
is still med rez, the VDI continues to use the med rez routines for
color handling and for line drawing. In particular, the VDI discards
requests to set color palette entries above 3, which is appropriate
for med rez.
Btw, it is merely by chance that the basic drawing routines for med
rez work (sort of) in low rez also. If you switch from low to med rez
and draw a few non-horizontal lines then, they look scrambled, because
drawing dots with a 4-bitplane algorithm on a 2-bitplane screen will
actually draw two dots.
The bad news for you is that there is no way to change resolutions
such that the VDI adapts to the new resolution. For this reason, it
is not possible to use VDI graphics (which are invoked by GFA commands
like LINE, BOX, CIRCLE and so on) after changing resolutions. The best
you can do is lock the screen (to prevent accessories or concurrently
running processes to draw anything), save the screen, switch resolutions,
draw your graphics using your own code for putting graphics on the
screen, switch back when done, restore the screen, and finally unlock
it. In GFA, this might look something like:

```
~WIND_UPDATE(1)
~WIND_UPDATE(3)
HIDEM
SGET save_screen$
~XBIOS(5,L:-1,L:-1,W:0)
'
' Write graphics directly into screen RAM
'
~INP(2)
XBIOS(5,L:-1,L:-1,W:1)
```

```
SPUT save_screen$
SHOWM
WIND_UPDATE(2)
WIND_UPDATE(0)
```

It might in principle be possible to make the VDI switch its drawing algorithms and other behavior to another resolution by modifying undocumented, internal VDI variables. The German c't magazine once published a hack that fools the VDI into drawing to a larger, virtual screen.

```
: I am wondering what Warp 9 does that allows the full 16 color low rez
: pallette and if I can incorporate that into my program. Or if there is a
: better rez change procedure I can use that lets me use all the colors and
: maybe even adjusts the screen size to the proper 320 pixels and back.
```

Warp 9 replaces the VDI, so it may be different or enhanced with respect to the standard VDI in various ways. It could be that Warp 9 notices resolution changes by hooking itself into the Xbios trap and catching Setscreen calls, or by checking resolutions in the VBI. I can only speculate here.

> Just remove the Rams and replace with 4*1 meg SIMMS, its that simple, that is
> if you are into soldering and the such like....

Ah no sorry. The point I was making was that I already have 4 megs of
256*4 and hence want to add that - the 1*1 memories don't present a
problem, I appreciate that.

However, what I need to do is demultiplex the A9 line and then gate it to
create new CAS lines, which will be latched with RAS (per bank). I was
just wondering if someone had already done it or had a schematic.

I realise that the original ST MMU's can't handle this directly but can
the later STE's handle 2 chip SIMM's (being made up of 2 256*4 chips) up
to the full 4Mb, if they can, then I'm looking for a schematic for that.
If anyone has such a beast - please own up - it could help save me from
re-inventing the wheel.

Cheers, Martin.

3438. What to do with unused 2.05 ROMS???

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-23 04:12:18 UTC
From: chanck@tartarus.uwa.edu.au
Message-ID: <2ub232$21a@styx.uwa.edu.au>
Source record: 31766

Hello everyone.

I have just upgraded my TOS on my MSTE 4 to 2.06 and
have the old 2.05 chips lying around. I also have a 1040STFM
which has TOS 1.02. Isthere anyway of using the TOS 2.05 in
the 1040STFM?

There can't be much difference between the tos 2.05 and 2.06
is there? Would I be able to plug it into my other 1040STFM?
If not how about getting the TOS switcher board that is used
for the upgrade to TOS2.06? Can I use that with my 2.05 roms?

Any help would be much appreciated as the 2 chips (2.05)
would justbe collecting dust as decoration pieces on top of
my monitor. :)

regards
Gary
chanck@tartarus.uwa.edu.au
chan_c@kultarr.uwa.edu.au

PS: I sent a previous mail but seems that it got designated to our
/tmp directory never to see the light of day :) :)

So if it does make it then please forgive me for a double post.

You should try the last version of make for Mint. It's on most ftp-sites.
I use it, and it finds "makefile" and "Makefile" in your current dir.

> Now I'm trying to find some better
> documentation on minix because I don't know which executes first, rc
> or profile. Whne I log in, I have to source profile to get my paths

If you have enough memory (4Mb would be nice) you can try installing the init package.
Again it's on most ftp sites. It works great and executes your shell as login shell,
so that your .profile (or .login for csh) get's executed automatically.

Hope this helps,

Richard.

: You pay Brainstorm money, and then they tell you how.

No, no. You pay >>>Atari<<<, not Brainstorm.
Atari paid us for this development, and the program+sources belong to them.
Then, they decided to give the information you need only to
'JPEG registered developpers': You pay about 100US$, and Atari gives you all
information you need, as well as the rights to use it (the decoder) and give
it with any of your programs.

>> Brainstorm receives nothing <<<

My personnal opinion is that they should have putted all this information
in the public domain, allowing everybody to use it.

Now, the good question: Who can you contact at Atari, for obtaining this
licence? Just try Bill Rehbock, Mike Fulton, or Normen Kowalewski, maybe...
I don't know.

I received some great mail on the problems I experienced with getting
Minix set up.. and MiNT as well.

The documentation that comes with the distributions is quite hard to
follow for someone who's trying to get this set up on their own and
isn't an expert in setting up OS's.. which is my reason for attempting
this, is to become OS strong and learn a little C programming in its
native environment.

If someone out there, who is very experienced in getting MiNT/Minix to work could
write up a set of documentation that covers the very basics of getting
this environment set up and progressing into more technical issues
gradually, I think it would be a great service to the rest of the
users.

This sounds like an aggressive project, and would probably require
several hours of typing, but the results would be well worth the
effort and there wouldn't be 'boneheads' :) like me asking the same
old questions over and over.

> Does anybody know how to connect the DSP SSI to DMA, with handshake
>enabled? Especially how to set up, send and receive with the DSP.

How to use the DSP56001 SSI interface?

The SSI is connected to the Matrix, so you have to configure the Matrix. It's
a little more complicated than communications with the HOST port, but once you
get the settings it's almost every time the same for any matrix settings.
The SSI is a serial line than can work in either normal mode or network mode.
On the Falcon you have to use the network mode which put the DSP in a `slave'
mode.

Here are the DSP SSI registers and the used bitfields:

o Control Register A (CRA) at X:$FFEC
. bit 14-13: Size of a word in communication (%00=8bits, %10=16bits)
. bit 12-8 : Size-1 of a frame in words (word number for a sample on each
track: 2 words for a stereo track, 4 for two tracks...)

o Control Register B (CRB) at X:$FFED
. bit 15 : Receive Interrupt Enable (RIE)
. bit 14 : Transmit Interrupt Enable (TIE)
. bit 13 : Receive Enable (RE)
. bit 12 : Transmit Enable (TE)
. bit 11 : Mode Select (MOD). MUST BE ONE FOR *NETWORK* MODE!
. bit 10-0 : to be cleared...

o Status Register (SSISR) at X:$FFEE
. bit 7 : Receive Data Register Full (RDF)
. bit 6 : Transmit Data Register Empty (TDE)
. bit 5 : Receive Overrun Error (ROE)
. bit 4 : Transmit Underrun Error (TUE)
. bit 3 : Receive Frame Sync (RFS) (start of a frame)
. bit 2 : Transmit Frame Sync (TFS) " "

o Receive Data Register (RX) at x:$FFEF

o Transmit Data Regsiter (TX) at X:$FFEF

I hope this help!

Stephane.

Your monitor needs to support 72kHz horizontal scan rate and _should_ have
at least 130 MHz bandwidth (but it doesn't have to).

3450. Re: C programming: calling the file selector

Well, actually I said Gemfast's lib included emulation. But I quote from
page 45 of the docs:

This implementation of fselexinput() is compatible with all
TOS versions. It checks the TOS version, and passes the
call directly to the AES on later versions, or emulates the
new functionality on older AES versions.

But you sound like someone who's used HSC. Anything else I should be
aware of about the docs? I spent a couple of days trying to get
fsel_exinput to work before adding the underscore.

As an aside, I am not complaining about HSC. I'm pretty impressed with
the work that's gone into it, especially considering the price (free).
Thanks, Ian.

Well, I believe you can do it by purchasing a special board (call Toad
at 1-800-448-TOAD and ask them about it) marketed by Gribnif or the
Codeheads. However, 2.05 did have some fairly serious bugs in it (I
seem to remember that they related to DMA stuff, but I cannot be sure).
Also, if you installed 2.05 in the 1040, a lot of games will probably
no longer work on it. I have a Mega2 with 1.02 in it, and I intend to
leave it precisely the way it is so I can run all the stuff that does not
work on my MegaSTE (which is quite a bit of stuff). If all of your stuff
works on either machine, it is not a concern (though that would be amazing,
in my experience).

> Any help would be much appreciated as the 2 chips (2.05)
> would justbe collecting dust as decoration pieces on top of

Such is life :-). You might try selling them to a Gemulator buyer, but
the Gemulator might already come with TOS (I'm not sure).

>higher sync signals feasible.
> Can anyone tell me if this idea has any merit?

This has been done before - the products were called PixelWonder and
Megascreen, where one was a reverse-engineered copy of the other (don't
remember).

They used a 6845 display controller for making new sync signals.

> Mainframes etc.

Well... This is an interesting question. You, actually, _can_ find it - when you know who to ask... I know someone who got his - after long, difficult negotiations ;-) ! It's crazy, I think; the program has been abandoned; nobody'll ever make money with it. Still, it's illegal to spread it around. So the work of guys at Insignia will never help anyone...
Law is law - but common sense is common sense. These kind of programs might as well be given to Public Domain, I think - that way they might be useful for even someone somewhere.

In ST-Format mag they said that GST - the firm behind e.g. Timeworks Desktop Publisher - _HAS_ created a patch program that'd make it possible to use Speedo GDOS with Timeworks 2. But the firm (that started with Atari...) announced that they ONLY support PC today - so this very necessary little patch doesn't seem to come out ever. Even in public domain; ST-Format claims that GST just doesn't care... >=-(

If (!) this is true - it's a good example of extremely disgusting business... Are computer programmers and/or publishers really such assholes who strictly think about business - no matter what the customer feels..? Opinions, people - both we, who use and you, who make commercial programmes.

Should anyone be loyal to someone who'll betray you when something more profitable comes in sight..? That's something to think about - especially for those, who abandon Atari platform after a long relationship.

3456. Query - syslog daemon for MiNT?

Newsgroup: comp.sys.atari.st.tech

Some of the new MiNT net software packages look like they're set up to work with a syslog daemon to record kernel messages. I've looked around on atari.archive.umich.edu for such a beast, but I haven't been able to find anything.

Does a MiNT syslog daemon already exist?

Thanks,
dgc

Try the immense pictorial archive at wuarchive.wustl.ed, where trial and error will almost certainly guarantee good results. The archive has not been indexed lately, but old picture indices are annotated and describe the pictures and their quality, and you should find pictures to your taste.

: What is the better Viewer, Photocrome or
Gemview, Speed of Light : was not as good as Photocrome to me that is...

GemView is a memory hog, with a clumsy interface, but extremely powerful, and has the sterling ability to configure its display to your system. It is expensive and english documentation is very limited, hence my failure to register it or rely upon it. Speed of Light does a very good job of reducing large GIFS and JPEG's to display their best on an ST/e low-res screen, but the test versions I have tested are buggu, crash often, and the GIF files it writes are often corrupt. Stuart has also disabled his latest "size filtering" feature in his most recent release, and I was not able to test it to my satisfaction. Again, I have not chosen to register it. Photochrome 4.0 does not allow one to display or process at a Mega STE's full speed, and does not do a good job in reducing most pictures to display on the STE's screen without a great deal of distortion. It does do a magnificent job on the pictures that it can display within those limitations.

As you can see, I am dissatisfied with all threse programs (although I offer their hard-working authors honest feedback and a chance to make improvements), and their is still need for more capabilities. There is a rumor that the brilliant Damien M. Jones (of View II Fame) has a world-beater in the works.

The main FTP site I check out for cool GIFs and JPGs (primarily computer-art, but all kinds of pix are there) is at wuarchive.wustl.edu in the /multimedia/images directory. under which there is a gif and jpeg area. There are some INDEXes, but I doubt they're all that up to date. And the newest stuff appears quite often in the unindexed directory under the gif and jpeg areas...

>What is the better Viewer, Photocrome or Gemview, Speed of Light
>was not as good as Photocrome to me that is...

The best display for GIF files is Photochrome *on a stock ST/STe*. The fastest viewer for GIF/JPG (and one or two others) is probably Speed of Light. And the viewer that will let you look at the *most* graphics formats is no doubt Gemview...

If you have a TT/Falcon, then I would aim towards Gemview or SOL (Gemview if you have a truecolor system)...

If you're sticking to GIFs on a stock ST, Photochrome will give ya the best results (but is significantly slower than SOL)...

Yes, it's a part of the MiNTOS package, look for either mintossc.tgz or
mintosbn.tgz somewhere under the Mint directory hierarchy. Alternatively,
you can ftp it from:-

ftp://earth.ox.ac.uk/pub/mintos

>Thanks,
>dgc

Steve

PS. By the way, yes, I am working on a new release and the binary
distribution will have much (if not all) the MiNTnet utilities set up in the
correct places with the rc scripts starting the daemons.

It's in the init package (called mintos) of Stephen Usher.
This is a package you really should install if you have enough memory (at least
2.5Mb) and harddisk space (don't know precisely how much, around 3Mb I think).

Richard.

3462. Q: Jove's tmp dir and Screen Problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-24 09:28:37 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2ue905$jdi@clss3.bangor.ac.uk>
Source record: 31789

Hello,
The subject says it all really, whenever Jove tries to save an auto backup file I get something like 'Cannot save D:\TMP** : Auto backup aborted'
I'm running Jove under MiNT, with a Minix partition. The enviroment variables TMP and TMPDIR are both set to /tmp so I don't know where it's getting D:\TMP from.
Has anyone got any ideas ?
Also.... Occasionally my screen (when using MiNT running in mono on a hi-res monitor) suddenly has black vertical stripes (two characters wide) and the screen shifts a couple of centimetres to the left ! (also the right hand column of characters appears on the left) If left for a while the vertical stripes usually dissapear but still leaves the screen shifted to the left with the right hand column of characters still being displayed on the left...
Exiting mint leaves me with a shifted gem desktop.... Resetting the computer corrects everything....
Has anyone ever experienced this before ?
Does anyone know of any solutions ?!

Cheers,

Dylan

It works but it only got to beta. It's also a 2+ year old version of their SoftPC
product. they told me that if they ever did sell it it would have to be for
150-200GBP to be worth their while. Seeing as a hardware emu like an 8086 one is
50GBP - it's hardly worth it. On a Falcon, SoftPC runs with a Norton of about 0.6
and about 1.2 on a TT.

I think (I do a lot of that) this is a bug of the Mega.
Since I use wrap_fix from a.a.u.e. it never occured again.

>it. The software is done, so release it. Sheesh.

If only it were that easy. You must try to understand the issues from the
software publishers's (Insignia) viewpoint. If they put their name of a
product, that means they are committing themselves to support the product
and to market it as aggressively as they do all their other products. Many
of the larger publishers are publicly held companies who are responsible
to their stockholders for the bottom line and must explain why Product X
did so poorly in comparison to the rest of the product line.

Next, many people tend to underestimate just how expensive it is to get a
new product to market, even if it is just a 'port' to another platform.
Besides packaging, marketing and distribution, their is support to consider,
which has rapidly become one of the most expensive factors.

Lastly, many more people just have no clue as to how SMALL the Atari market
is (and getting smaller all the time) compared to those 'other' platforms.
The difference is staggering. It's a wonder we have ANY Atari software!

Just look at all the software companies who have dropped support for the
Atari. Why did they decide to do so? Not because they didn't like us (well,
most of us), but because the Atari market COST them money or the shrinking
profits were so small as to not be worthwhile in maintaining the line.

These are _businesses_ after all, folks. The purpose of which is to make $.

Food for thought...

As far as being 'assholes,' perhaps some are from our viewpoint. But again remember they are in this as a business. It feeds their families, puts a roof over their heads, sends their kids to school. And just like you, they want the best life they can build for themselves. Due to our small size, Atarians have been spoiled by the personal service the individual developer gives to his customers, often at great cost to his 'business.' They don't all work that way.

>Should anyone be loyal to someone who'll betray you when something more
>profitable comes in sight..? That's something to think about - especially for
>those, who abandon Atari platform after a long relationship.

You wouldn't blame anyone for feeling that way, but the point is, will it really make a difference. If ALL Atarians who felt snubbed by a certain publisher absolutely refuse to buy their products when they move to a new platform, would it matter? Would it make a dent in their business? Would they really even notice? Not likely, folks. That few number of ex-Atarians would be less than background noise. And all for the revenge of 'showing them a thing or two' (while depriving yourself of the use of their software).

It's not fair, but then again, neither is life. ;-)

Enjoy what you got, while you got it. Tomorrow will take care of itself.

* * * * STUFF DELETED * * * *

AFAIK the MMU has all the lines needed to address 4 Mbytes, although there
are stories about some being defective, & only addressing 1Mbye.

So, you could use 256kx1 or 256kx4 rams, the big problem is that you can't
put the 4 bit rams into the spaces for the 1 bit type.

There are instructions on a.a.u.e for adding more memory to ST's, maybe you
could get some ideas from these?

The simplest solution might be to make up 4 boards, each with 8 rams,
arranged in a 1Mbyte x 8 bit array & solder these to the holes on the PCB,
taking the extra address line from MMU, as per the instructions.

It's not an easy project.

3469. Qfax & Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-24 16:49:34 UTC
From: paul@deluxe.textlitho.nl
Message-ID: <EFYQDJUQ22-UP@deluxe.textlitho.nl>
Source record: 31802

Hi!

Who would know how to get QFAX working on a Falcon?
I have a TKR144 modem, FSER & FPATCH in my autodir and no matter
what adjusdments I make the buggar won't work.
At best it rings and won't recognise the remote fax; at worst it
report a 'modem timeout' or a 'senderr -10'

I had a look at Straight Fax and that one sort of seems to work
(although 100dpi faxes look weird and it cannot handle multiple page
faxes correctly) and I sure miss the flexibility of Qfax. Comms prgs
run fine on my Falcon, but when a fax comes in I have to fire up the old
Mega to receive it (and missed quite some.. :/)

Any help much appreciated,

paul

Because Atari (UK) backed out of their deal with Insignia, so
Insignia's not about to spend (waste???) its own money trying
to sell it.

G'Day GFA wizards!

I'm looking for some source that will allow me to send a list of ASCII lines from a text file to a window and select a line from it using the scroll bars etc.

I looked in the GFA manual and I think it'll need to involve lots of AES calls and the like. If I wanted to bother with this crap, I wouldn't be using Basic!

Is this in your library of standard routines that you could post to me?

>it's unreliable (just could be my system; it worked fine at SCSI ID 0,
>but acts flakey at any other ID).

Would that be an ST-296? :) Mine makes a 'chink-chink' sound when it seeks. I've had reliability problems too. A year ago I added the ST-296 as the third drive using SCSI ID #2, and it worked fine 'til a month ago. Taking the Quantum Q240 out of the system cured the problem. I also had a Seagate ST-125 (3 1/2 inch, HH, 20M), which was quiet and ave. speed for it's vintage.

>A lot of people also like Quantum drives... I think they're noisy
>though, especially when seeking. I've got two (got 'em for $60 each,
>not bad for 52M disks) and I've never had any problems with them.

I replaced all 3 of my older drives with a Quantum lps240. This drive screams (ICD's RATEHD reports something like 1.2M/sec) and I have to take the cover off the case to hear it :)

3477. HDs in the Mega STe?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-25 15:27:00 UTC
From: gwood@tibalt.supernet.ab.ca
Message-ID: <2uhic4$bph@tibalt.supernet.ab.ca>
Source record: 31624

Hi Everyone.

I'm facing a problem. Yesterday, I swapped out my 170 Meg Conner CP30170E SCSI HD from my DOS box with a 420 Meg Western Digital, 'cause I needed the storage. Now I have this 170 Meg SCSI that I'd like to put into my Atari Mega STe. It's a 3.5" unit, and I thought "No problem. Just yank that Seagate (yechhhhh!) that Atari put in there, drop the Conner in, and run the Atari AHDI utilities to recognize it, format it and use it."

Boy, was I wrong. After about an hour of tinkering, including setting the Conner's jumpers to every conceivable value, I came to the conclusion that whatever I'm doing wrong, it's a doozy. AHDI 5.0 and its associated utilities can't even *find* the drive, let alone format it.

Anybody have any ideas?

If there's no internal SCSI controller, you'll have to shortcut its
connection.
Therefore, place a jumper onto pin pairs 1 to 8 of the internal
connector.Start counting from the front end of the machine.

(Why? Because the eight data lines are looped through the internal SCSI
adaptor - if there's none, there's no data lines on the external
connector...)

bye, Peter

The ST port of JOVE is (1) old, and (2) somewhat buggy.

We, the official maintainers of JOVE, are about to release a new version. Unfortunately, we don't have a fresh ST port. I would welcome any offers to port the latest version. I can even help a bit since I have a (dusty) ST. Unfortunately, the ST C compilers that I have at hand are not good enough.

The new version of JOVE is quite a bit better than older versions (except that it is bigger).

What does it do? Is it an external host adaptor, similar to the ICD Link?
If so, the Link 2 (soon to come out, I hear) is supposed to do everything the
Link could, plus have an LED to positively show presence of termination power
and the ability to handle drives with or without parity. It supports
flopticals, fixed disks, removable disks, CDROMs, SCSI tapes, etc. etc.
The Link (and presumably the Link 2) run about $100US. How much is the
"Translator"? The ICD software is very nice, and is still being actively
developed. This is a big plus for ICD host adaptors, IMHO.

Nope! PC DITTO chokes on the Falcon's TOS (and I think the TT's),
refusing to run on an unsupported TOS version. Maybe someone
could get the source code from the guy who wrote it and update
it? Then again, it would probably be a lot easier just trying
to get Insignia to release SoftPC for the Falcon/TT.

Are you sure they are real ROMs? All the MEGA STEs and TTs I upgraded
yet, had EPROMs inside. If so, you can burn TOS 2.06 into them. But
remember the copyright-problem!

Bye,
Knarf

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there

I've just read the issue of ATARI ST Magazine, and I noted with interest
the article outlining the existence of a new cheap SCSI cable device
called the 'Translator'. They mentioned something about a HD parity
requirement limiting the types of devices usable.

Are there any other bits of relevant limitations one should know before
running out with cash in hand to buy the sucker...

Can this device support a typical chain of SCSI devices (0-7 with CDROMS, Tape
drives etc...).
Any other information of interest would be great.

Reply to the NG for general consumption please...

Thanks

.>Recently I began thinking that it might be possible to get higher
.>resolution video modes out of a ST by substituting the standard h-sync
.>and v-sync with my own sync signals. Normally this wouldn't work, but I
.>the overscan modification makes changes which I thought might make
.>higher sync signals feasible.
.> Can anyone tell me if this idea has any merit?

.This has been done before - the products were called PixelWonder and
.Megascreen, where one was a reverse-engineered copy of the other (don't
.remember).

.They used a 6845 display controller for making new sync signals.

.bye, Peter

Do you (or anybody else!) have any more information on these products?
Like, what is the resolution increase, how difficult to install & how
compatible
with existing software?

How many more products are out there that don't even make it into the
FAQ's?
Maybe somebody could compile a list & pass it on to the FAQ maintainers.

The Apple CDROM300 seems to be the drive of choice in the UK. It's sold complete with Atari drivers, cable and SCSI interface for 300GBP here. (less if you have a Falcon as you don't need the SCSI i/f). There are quite a few drivers available now. mail ssolutions@cix.compulink.co.uk for details.

Is Geneva a complete GEM & AES replacement? The reason that I am asking is that MiNT has been ported to the Mac, along with a program called JET or Just Enough TOS. This package runs text-only ST programs on the Mac, but lacks GEM and AES. I would like full emulation(!), and wonder if Geneva or some other program is the sort of thing that I need, or is approaching it.

I personally found the HiSoft C Interpreter (which I _paid_ for) very helpful as a learning tool and an editor. I agree that it is a problem that it isn't ANSI or true K&R compatible, but as a concept, as an editor and learning tool, it is fantastic (for me). I wish I had it on the Mac now that my ST went the way of all silicon. Which is why I hope for GEM and AES to be added (somehow) to MacMiNT.

From: steves1825@aol.com
Message-ID: <2umugu$keg@search01.news.aol.com>
Source record: 31831

I am also interested. MiNT has been ported to the Macintosh. My 4 meg ST died, so my Mac is it. I want to run my ST software, of course. MacMiNT (0.95) and JET (Just Enough TOS) do not include GEM and AES. So I can only run text-only TOS and TTP programs, such as the GNU compilers (for which purpose it was ported). But it is said that MiNT 1.10 has been ported, and I know that MiNT is the basis for MultiTOS, so, I need to find the other files I need to run what I _do_ have, and am interested in any effort to complete the port for full ST emulation.

Ah, while that might _seem_ like a viable solution, it just doesn't make much sense, particularly for a larger company like Insignia. I'm sure they have their own reasons, but I surmise this wouldn't work because:

1) Even if it's shareware, they would still have to support it,

2) They don't consider Atari shareware to be a viable money maker (the only way shareware can be viable is if enough users actually send in the registration fee and there simply are not enough Atarians left to do so),

3) They are worried that their commercial Mac and Unix versions of SoftPC might get confused with a _shareware_ Atari version,

4) I think Atari UK backed out on a deal leaving Insignia in a bad way (which doesn't exactly endear Insignia to Atari or Atari users),

5) They consider all Atarians pirates and they hear from the Internet that copies of their beta product is already freely available so why bother?

Just my $.02.

Hello

I'm looking for a CD ROM player, and would like to know what u use and
like to use, and with what software you run it...
I've looked around in some many shops and found out (still sounds stupid to
me but..) that the cheapest SCSI CDROM player was the Apple CD 300,
external! I must be wrong (or the shopkeepers), because internal CDROMS
seemed to be more expensive.. Hmm

What CD ROM (dual speed XA audio and the works) is the best buy? What
Software should I use (eXtendos?)

Let me hear! :)

LSD,
Ludo Sak
L.J.Sak@kub.NL

Thx ;^)

>calls and the like. If I wanted to bother with this crap, I wouldn't be
>using Basic!

Ha! If you don't want to mess with this 'crap' (AES calls, etc) you should
be using a DOS machine instead of an Atari. GEM's AES is what makes those
nice pretty windows and such available.

But sorry, there is no standard routine that I know of to do what you
plan. You'll have to create the window, fill it with a scrolling list,
and track which line in the list you wish to extract.

Yep, even BASIC takes a modicum of work, I'm afraid. :)

Good luck,

-Hutch- @ Fair Dinkum Tech

I'd pay $5 up front, right now, for a copy of that IBM emulator. Even if it sucks rocks, I'll pay $5 for it, just to play with it. They'd be guaranteed $5, rather than nothing which is what they're getting now for it.

I have a Chinon 431 and an NEC 84.
I wrote my own MiNT CD-Rom driver. (You'll need this for Pioneer 600 drives :)

<BLATANT ADVERTISING FOLLOWS>
I use my MOST program to view Compton's New Media M.O.S.T. CD-Roms.
(demo version MOST.ZIP uploaded to a.a.u.e last week)
<BLATANT ADVERTISING COMPLETED>

I normally look through the following M.O.S.T. CD-Roms
1) Doctor's Book of Home Remedies
2) KGB-CIA World Fact Book
3) The Pill Book
4) The King James Bible
5) U.S. Presidents

I also own
1) GIFs Galore
2) Simtel Source Disc (Not very usefull but interesting source code)
3) PD disc from Profit Press (One of their Sampler Discs)
4) Amiga Source Disc (Again, not very usefull but interesting source code)
5) Compton's Multi-Media Encyclopedia (Program to use not quite complete)

|>
|> What CD ROM (dual speed XA audio and the works) is the best buy? What
|> Software should I use (eXtendos?)
|>

I would recommend ExtenDos because :
1) It works
2) Does not require MiNT/Multi-TOS (important on 8mHz ST)
3) Works with MiNT/Multi-TOS
4) Supports most CD-Rom Drives with Photo-CD capability

>
>Are you sure they are real ROMs? All the MEGA STEs and TTs I upgraded
>yet, had EPROMs inside. If so, you can burn TOS 2.06 into them. But
>remember the copyright-problem!

So, in theory, I should be able to take my TOS 2.05 out, and burn in 2.06?
If so, how could one do it, and would it be worth it. Via legal channels
of course.

Joseph

3520. SLM 804 Laser Printing Problems (Word Writer/Geneva) (Help!)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-28 00:22:31 UTC
From: ehood@convex.com
Message-ID: <2unqg7$8j3@lovecraft.convex.com>
Source record: 31696
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Problem 1:

I'm having problems getting correct printing on my SLM 804 laser printer with Word Writer. Everything will print fine for the first page, but subsequent pages get all garbled. Also, if I try to use different fonts, text gets indented after I use a font different than in slot 1 (as specified by the SETUP630.PRG). Has any one had success printing on a SLM 804 with Word Writer? Can I get a copy of your .CFG printer file if "Yes"?

Problem 2:

When Geneva is running, and I print to the laser printer (via Steno or PageStream), sometimes the printout gets messed up. For text files, the characters get all bunched. For graphics (or PageStream text), the graphics get clipped and garbled.

Any help is greatly appreciated. Please respond via e-mail if possible.

I canabolized my Atari and placed all the useful parts into
my Intel computer.

I have 4 programming books, Word Writer ST, Laser C 2.21 and Debugger,
UIS III, NeoDesk (1989 version), and some other programs I want
to give away.

Respond to this post. First responder who is willing to
drive to Round Rock gets it.

LEGALLY, you COULD have TOS 2.06 burned into the EPROMS,
but ONLY as a backup to your original TOS 2.06 ROMs (i.e.
you can't sell them OR use them in another machine!).

The only way you'd be able to do it (LEGALLY) is to buy the
MultiTOS package that has the GEM.SYS file in it and THEN
figure out how to get it to run with MacMiNT (plus you may
NEED to have legitimate TOS ROMs as I understand the GEM.SYS
file doesn't have EVERYTHING in it, so you'd need a board to
hold the TOS ROMs) as you'd need some kind of emulator
program to make the Mac pretend it has the Atari hardware
there. Full GEM emulation on the Mac would require quite a
bit of work -- though it would be VERY interesting to see
someone do it. There are a few rumors that someone IS, in
fact, writing a full GEMTOS emulator for the Mac and/or
Power Mac.

One possible solution would be if Insignia let another
company sell it under a different name so as to no
longer have it associated with Insignia. That would
take care of #1 and #3.

While another company might not be able to pay enough
money up front for Insignia to sell it outright, maybe
they could arrange a deal whereby the other company
pays royalties to Insignia on a per copy basis (e.g.
this company sells it for $25 wholesale and pays
Insignia $10 per copy sold). Insignia's not make ANY
money on it by just sitting on it -- this way they
could make back some of the development costs.

I'd try to do it myself if I had the resources.

I'm at v 6.0.0 of the ICD utilities. What's been changed since then? Is it
worth my time to upgrade up to 6.5.5?

Also, what are "non-pro" utilities? What would be "pro" utilites?

>What WordPerfect 5.1 fiasco? Well, all the better. There is no WP worse than
>Word Perfect. Imbedded codes? Sure... they're on the ball.

A number of years ago, Atari Germany had made a deal with
WordPerfect Corp. to make WP v5.1 (based on the NeXT version)
for the ST by promising to buy at least 50,000 copies of it.
Before it was finished, Atari Germany reneged on the deal, so
it was scrapped. What WAS finished on it was pretty
impressive according to the few people who saw it! WP v4.1
for the ST is pretty crappy, but v5.1 was said to be top-notch!

Last I heard he was programming the Jag. Atari pulled him off MiNT as they were short staffed and needed some Jag work done. He still posts to the MiNT mailing list.

A firm the size of that which which owns Soft PC (Can't remember the bloody
name!), would probably lose cash if you gave them 5$. Most firms couldn't cover
the staff costs of copying the disk and bunging it in an envelope atthat price.
When I last spoke to them, they asked what I thought the market would pay for
such a beast if released and Isaid no more than 50GBP. They said they couldn't do
it for less than 180-200GBP. More than most hardware emulators.

Forget it, they just can't do it at a price the Atari market could withstand.
They have nothing against the Atari and if they could do it, they would. I talked
to a fairly senior guy in the UK who says they still have the TT they developed
it on. BUT - they can't do it for less than 180-200GBP. It's no use saying why
not just release it as a basic disk for a few GBP just so people can use it. a)
it's beta and b) Insignia are a reputable company who can't have half baked
'free' versions of their bread and butter application floating around and still
appear professional. It's like Compaq or somesuch saying 'Hey we've got this
great program, it's still buggy and we wont sell enough to cover costs so have it
anyway.'

I have found a very simple way to turn OFF the Drive in my MEGA ST2..

I have a Floppy with ByePass Hard Drive and Cold boot set up
in the Boot Sector by using DC Format...

I also have Ataries later Ship/Park Program the 776 byte one that can be used
as a ACC...

I use the Floppy to boot up the system, this byepasses the Hard Drive,
the Ship/Park Program is used to turn OFF the Hard Drive, as a Program..

After 30 seconds or so I exit the Ship/Park program, ie, to let the
Hard Drive spin down...

This sort of works, but I end up with multible entries in my
Floppy disk directory..?

I have found one way to clear this with out causing the Hard Drive
to spin up, I just hit the reset button...

Can some one explain why I am getting multible Directory entries
with the Floppy drive...A Drive that is.....

Thanks....

If you want a plain TOS-Program running in a window
you might use MTOS.
The only other way to get it running is to programm
with AES and VDI. This is a little bit difficult but
very powerfull. If I get the time on weekend and if I
think of your problem I might change my sources to
a prog that uses simple windows (shouldn't be that
difficult - you don't want to use dialogs in windows
and user defined objects, do you ?).
Really hope that I'll have the time, but weekends are
always very short ;-) and I'll have my test in two
weeks :-().

I know, I know, bad form following up on your own article...

in thinking about this, I see 2 "real" solutions. one is to hack up my
midi port to act as a second serial port and connect it to the PC. then
I just need to run a term prog on the PC to send data to my ST and
somehow redirect kbd io (bconin??) to get data from both the kbd and
the midi port.

second, locate a box that speaks rs232 on one end and mega kbd protocol
on the other.

help? pointers?

3541. T28 / PAK-3 questions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-06-28 11:32:08 UTC
From: e2daka5@etek.chalmers.se
Message-ID: <1994Jun28.113208.22081@etek.chalmers.se>
Source record: 31718

Hi there!

I'm seriously thinking of putting a little more speed to my old 1040STFM and after reading a few ST-magazines, I've settled for either a T28 board or a PAK-3 board.

I want to know what problems might occur after mounting these boards.

Is the T28 a better choice if I want to run as many of my old programs as possible?

How do you, anyway, get a 68000 to work at >16MHz? As I understand it, the T28 board uses the old CPU, and it shouldn't be possible to run an ordinary 68000 that fast.

Any answer is appreciated, especially from T28 or PAK-3 owners.

David Kaplan

Well, Atari probably has him working on Jag-related stuff, but I
doubt he's given up working on MiNT. I mean, it's basically his
"baby" (probably better to ask the folks on the MiNT-mailing list
anyways)...

Correct.

> If so, how could one do it, and would it be worth it. Via legal channels
> of course.

I don't remember all the changes from 2.05 to 2.06, but I think it
would be worth upgrading. You just have to get access to an EPROM
burner and burn in the TOS 2.06 image.

But I don't think there's a legal way to buy the license just for the
image file without the EPROMs. But ATARI has always tolerated this.

Bye,
Knarf
